Thread: [BIND and a webserver HELP.](#)

Coffee is love - February 2, 2015, 7:12 pm

How exactly do I go about hooking my own DNS name from my computer.. to a webserver thats also on my computer, I tried to use the name servers out and use someone elses nonsense but it wont resolve the ip, I don't know what to try next

SawCyanic - February 3, 2015, 7:26 pm

Just point your A record on your domain to your public IP. You may or may not want to use a free DNS service like Cloudflare's, freeDNS, or Namecheap's Free DNS service and set the A record and other records there.

asterisk_ - February 3, 2015, 7:29 pm

you're hosting a web server on your home network? not the greatest idea but OK.

I suggest setting up dynamic DNS just in case your IP changes, and as the user above me has said, just point the DNS A record to the dynamic DNS (a.k.a your public IP)

EDIT: you should also use cloudflare for ddos protection / security and to hide your public home IP, just remember to use an external server such as a vps for mail to make it more difficult to get the IP behind the CF
