Thread: [Skype resolver source](#)

Stealing. - February 4, 2015, 4:03 am

Hey there, I just coded this Skype resolver and I think this might be interesting for some of you beginners! :) So I don't want to give away the API, I got it from a member that is giving it away to L33t/Ub3rs only [in this thread](#) If you are not upgraded, just google for one. :)

Screenshot of my Resolver:

Spoiler [\(Click to View\)](#)

So there you go boys! :)

Code var

```
Form1: TForm1;  
sSourcecode, sIP, sUsername: String;  
Connection: TIdHTTP;  
implementation  
{ $R *.dfm }  
procedure TForm1.Button1Click(Sender: TObject);  
begin  
sUsername := Edit1.Text; // Reads the username in the Edit  
Connection := TIdHTTP.Create(nil); //Opens the connection  
sSource := Connection.Get('Your API here' + sUsername);  
sIP := Copy(sQuelltext, Pos('<h1 class = "IP">', sQuelltext));  
Label1.Caption := 'IP: ' + sIP;  
end;
```

Explanation : in the Connection.Get function you have to enter the url of your API as string, usually they end with : 'username=' this is why I had a + username at the end.

No problem, glad I can help those Delphi Coders!

Recursive™ - February 13, 2015, 7:59 am

Code Connection: TIdHTTP;

What do I put in the uses it to recognise this this variable declaration?

You need Indy for it and then drop the TidHTTP component from the panel. It should automatically add the required unit to the "uses".

Grrr...Trolls - March 2, 2015, 7:57 am

So without the API the code is useless?

I would ask for it but I dont need it at the moment ^.^ but think... you could use this sorta like a DNS to find the IP of your C&C... Make your rats/bots a skype account with your skype name added, then you could make them resolve your IP. Word of caution, so could the phedz lol... And TBH skype is owned by the NSA now lol...

Thanks for the share btw :) Sure it will be useful somewhere

Basically.. yes :D It's just something really really simple but effective. And that's something I did not think of before, nice idea man.
