Thread: [\[Tutorial\] Stealing files through Windows shortcuts.](#)

Yoshikage Kira - February 4, 2015, 10:55 am

In this tutorial i'll teach you how to steal files through windows shortcuts.

First let me tell you how it works:

When you select a shortcut to upload, it gives you the file the shortcut points to. Thus you can steal any file you want by making them select the shortcut when uploading a file, the problem with this is most file uploaders show the file name that's being uploaded, but don't worry! I provide a solution to bypass this.

Things you'll need:[Stealer Files](#)

[Free Hosting Provider](#)

After you create your free website, create a new database.

Then go to config.php and edit it with the details:

Next install file manager and delete default.php, then upload the stealer files.

Then go to phpmyadmin & import database.sql:

MAKE SURE TO CHANGE THE DEFAULT CREDENTIALS

Next go to <http://website/stolen.php> where website is your website & login with your credentials(default is greed@:perfect123 in user:pass format).

Now add an id & descriptor for the id:

I added the id 1234 with the descriptor "Greed's secret file".

Now we'll create the shortcut:

Let's suppose you want to steal the file C:\code\credentials.txt:

Then you'll create the folder code in C:\ & create the file credentials.txt.

Then you'll right click and do new->shortcut:

Then you'll input C:\code\credentials.txt

Hit next & name it whatever you want:

Then click finish.

Next go to <http://website/stealer.php?id=1234> to make sure it's working properly. If it appears all right:

then you send them the shortcut & have them upload it to your website:

Please be aware that relative paths don't work(ex: %AppData% or %Temp%), thus if you want to steal their Google Chrome cookies file you'll need to get their username on their computer and input the absolute path.

its awesome bro .. keep up ;) thanks anyway

AutonomousGirlFriend - February 4, 2015, 11:26 am

such a nerd :(i wish i was dis smartical

Articulate - February 8, 2015, 3:10 am

Thank you so much, This helped me alot :D

Abzorb - February 8, 2015, 3:21 am

thanks a lot this helped me aa lot! ;)

Yoshikage Kira - February 9, 2015, 12:55 pm

Glad to have helped :), updated broken links.

zw0scura - February 21, 2015, 4:19 pm

Good Job man, nice tutorial, look forward ?

1999 - February 21, 2015, 4:55 pm

awsome tut man very helpful :) cant wait for more :D

chernobiLe - February 21, 2015, 5:25 pm

ahah its brilliant thank you for tutorial man

lukejx2 - February 22, 2015, 5:14 am

damn son this looks good :) ok so i'm gonna look for a free hosting site now - any recommendations on which to use? what's a good path to use? do you write your own path inside the "cridentials.txt" file or? thanks in advanced, great post OP :)

for me it says "create a hosting account" before I can make a website, but the link doesn't work to create a hosting account :s

for me it says "create a hosting account" before I can make a website, but the link doesn't work to create a hosting account :s

A shortcut won't be created if the file doesn't exist, so you'll have to create the directories and file yourself mimicking the target's path.

Niely - February 22, 2015, 8:28 am

This is a really smart method.

Thanks for sharing this mate!

Nalgun - March 2, 2015, 9:21 am

Thanks for the tutorial really helpful, i appreciated it

chernobiLe - *March 2, 2015, 1:24 pm*

awsome tut man very helpful :) thank you so much

UknownG. - *May 6, 2015, 5:43 am*

Short and easy tutorial but very helpful

paul8819 - *May 19, 2015, 11:18 am*

great tutorial man, please send me youre skype/jabber, I think you can help me

tsaad - *May 19, 2015, 12:05 pm*

thanks for the great share ...

Regards

Abzorb - *April 18, 2017, 12:21 pm*

is it still working guys anyone knows?

memehack - *April 22, 2017, 3:16 pm*

omg . fam thats genius
