Thread: [Monitor failure](#)

vaidyz - February 13, 2015, 4:40 am

So i was surfing the net yesterday and my computer screen went black. i restarted the pc manually but it was still black. The monitor light beeps but it doesn't show anything, and when i press and hold the menu button on screen it says "Test Good" I have a video to show you that.. BTW my computer works fine but it can be anything [www\[dot\]youtube\[dot\]com/watch?v=6sqK-TSP3fg](http://www.youtube.com/watch?v=6sqK-TSP3fg)

Does monitor show anything at all like bios boot screen or manufacturer logo when you start computer. Have you try connecting computer to television. Make sure cable connections are securely fixed in place.

It doesn't show anything at all. I tried unplugging and plugging in the cords

I am using laptop currentlyCan you connect computer to monitor with different video port. If the computer has a graphic card then reset the graphic card by reconnecting the graphic card if that does not help then take out the graphic card and connect monitor to VGA port. Performing a monitor reset to factory default settings may resolve this issue. You can also reset BIOS setting by taking out CMOS battery or with jumper.

"How to Reset Your BIOS"

Maybe turn off and then on the power button that is located at the back of your case.. wait some secs. and then turn it on again. Then power up your pc.

Works for me.

let me know.

(as other said, try to re-plug your cables)

So i tried pressing delete button while my computer was turning on. I pressed it and heard a beep from a computer, anyways the monitor was not displaying anything and only beeping his led light

i think the problem is in my graphics card sadly. I didn't saw the fan wasn't spinning. I tried changing the slots, but it's the same

Use a post card to find out the actual problem.

vaidyz - February 14, 2015, 3:06 am

i dont think i have the post card in my pc
