Thread: [Game Server Attempts](#)

ROPUA - February 13, 2015, 9:14 pm

Note: This is not a thread where I am begging to be spoonfed, I legitimately tried a bunch of methods to crack this username and pass and now I need a bit of assistance or at least a push in the right direction.

I do not truly care about hacking this so much but I like the challenge and it is an interesting experiment for a noob such as myself.

Anyway I mope around this game server with CommView and find that if I put in the source IP in my address bar I get the page to the log in of the admin panel.

Entering this <http://46.21.154.203> ---> renders this link to the admin panel--->
(that I cannot post because I am not a str0nk enough user yet, but if you put that IP in your address bar you should get it.)

So I try to bruteforce this with Brutus.

I add the username of the head developer that I know controls this panel and Brutus renders some basic accepted user/pass combos like Admin/academia and a few combos with the head dev's name.

I try all of the combos Brutus recommends, no cigar.

Then I read up on HF about SQL injection and try to find a vulnerability manually. Once again, no cigar.

In what direction should I go with this/what should I do?

If you have tried SQL Vuns manually and you got no ciggy then you can try using a program called Havji, That might come up with something

Try finding other services on that ip. Maybe some of them could be outdated.

Viktory - February 16, 2015, 10:56 am

Find a better wordlist and try bruteforcing again. There's no captcha so it should be easy given you have a decent wordlist.
