Thread: [easy way to get bitcoins. \(to me\)](#)

TacoTejano - February 18, 2015, 3:29 am

This is how I do it

Things you'll need.

Gmail account

Computer with internet

SmartPhone (android with google play store)

USB drive.

Transportation if needed.

Money

Your gonna make an account on [localbitcoin](#) follow instructions... Write down you [mneumonic](#). Never save that info on your computer. Then your gonna do a two step verification.

With the two step verification. Your gonna download [google authentication app](#). Then your gonna download [barcode scanner](#).

Once you verify your local bitcoin account by email and phone. Your gonna get a digital wallet now.

Make an account at [blockchain](#). Then verify it etc etc. Save the mneumonic. And download the wallet backup file. Keep it in a USB. Never on your main computer to sit

Now get the blockchain app from google. On the app it has instructions. Your gonna log into your blockchain account on the computer. Go to account settings. Then devices... And on the app your gonna scan the QR code on the computer screen with the camera on your phone.

Once it is scanned. Your logged into blockchain. Its going to ask you to input a 4 digit pin code twice. Then your digital wallet is setup.

Now... With cash. Your gonna buy a [vanilla visa gift card](#). The one with \$20-\$100 deposit. They sell these allover walgreens. You can even go to vanilla visa website to find a retailer near you who sells them.

Once you have them. Don't activate them and keep the receipt. Your gonna need them.

Now... Go to localbitcoin and click on buy bitcoin and payment method vanilla. Find a guy with good ratings and feedback. Make sure his email. Phone. And drivers license\ID\passport verified. Those are the only folks I deal with.

Make the deal. And make sure he responds. He will have terms asking for pictures of the card. Front and back plus the receipt. And the amount with credit number expiry and CVV. When he responds send him the details. And once you get the bitcoin into your wallet. Seal the deal. And end the transaction. Drop your feedback.

Now go to your wallet in localbitcoin. And login to blockchain. Get the receive bitcoin code for blockchain.

Send your bitcoin from local bitcoin to blockchain.

Then its gonna ask you for a code. From the google authentication app. Authorize it but be quick because the code changes every few seconds. Now the funds are sent.

Check blockchain on your phone. Login. Boom funds are there.

That's how I did it. Hope it helps
