Thread: [Tutorial on ratting and also a few basic things for Beginners](#)

Alas - February 21, 2015, 10:56 pm

Hey?,

If you are a beginner and you are not sure where to start out here is what I did and what i'm still doing.

1) Download a RAT program, I recommend Nanocore for its high quality but it costs \$25, definitely worth it though. If you dont want to pay then darkcomet is a choice.

2)Download a crypter. Its hard to get a quality crypter for free so I recommend Boson Crypter it is what I'm using at the moment and I like it.(It is free)

3) Get upload rights on kickass torrents. This is a easy way to spread your rat.

4)If you need a website to anonymously upload files for people to download I recommend rghost.net

5) Using social engineering or luck to have someone download and execute your file(RAT). Techniques could be disguising your rat as Celebrity nudes, Minecraft account generators, LoL RP generators, Movies, Images, Free Games, Etc.

6)Access their computer and send emails to people on their email list with your RAT to get more slaves.

Thats The RAT tutorial over here are some other good things to do.

1)make an account at codeacademy.com and start to learn Python. Its free a having a good knowledge of at least one language will help massively in hacking.

2)Learn some very basic html and php for sql injections

3) Join a group of beginner hackers and learn with them.

4) Try to get a mentor to teach you.

5) Stay Motivated to learn! Always look around on the forums for new things to do and keep hacking!

I'm fairly new to hacking so sorry for any mistakes I just thought I would let people know what I did to sort of get on my feet. I cant stress any more how important it is to learn how to program if you want to pursue hacking!

Thank you for reading!
