Thread: [Corsair K70 RGB Not Working Correctly](#)

Doodlebob™ - February 27, 2015, 1:17 pm

Hey guys! I got my K70 RGB 2 days ago, and I'm having some problems. For some reason, the lights won't change and none of the extra buttons (volume, mute, brightness, lock) are working. They were working fine yesterday. The program is open and I tried changing profiles and everything. Anyone have any ideas? ?

Flash7475 - February 27, 2015, 1:24 pm

it is possible your keyboard could have died if it was fully functional yesterday, did you change settings before it wasn't working? but depending where you got it you can just get a new one under warranty if you have any and get a new one.

Typing still works fine on it, and the lights are on but the program won't let me change them. When I change them on the program nothing happens on the keyboard.

Try going into the process, and end the Corsair process.

Then reopen the corsair program, and see if that fixes it.

If not, is your Corsair software updated to the recent version?

Thanks! That seemed to work, weird I've tried restarting + exiting it and hasn't worked, but Task Manager did! ?
