Thread: [Looking for a port scanner source\[VB\]](#)

IMAGINARY666 - March 1, 2015, 2:34 am

Hello guys

I'm looking for a port scanner source... I know, there are some sources on the internet but they are very basic, or lead to memory exhaustion (really). I'd like something advanced, maybe a Syn scanner, or something that won't lead to memory exhaustion after i scan from port 1 to 20000... Please note that I'm not the kind that writes a code from scratch, I like to understand the code, and improve it, and maybe include it in something bigger.

Thank you very much.

nuk - March 1, 2015, 6:12 am

Here's one: <http://www.codeproject.com/Articles/17257/VB-Port-Scanner>

Here's two:

<https://www.planet-source-code.com/vb/scripts/ShowCode.asp?txtCodeId=904&lngWId=10>

BTW....that was after only 1 Google search and it was like magic or something LoL

One - Timers, it might not work well, but I'll give it a try, maybe I'll replace the timers with a background worker.

Two - 2003... cool

You could download one of my old ones that I made a long time ago.

<http://www.mediafire.com/download/aqtpakj6d0z516c/Port+Scanner+-+Keiko.rar>

Educational purposes only.

Sorry but it doesn't work remotely... I can only scan 127.0.0.1

Btw i have this, and it does work remotely, but only for a certain port

Code Dim logonServer As New TcpClient()

```
Try
logonServer.Connect(ip.txt.Text, port.txt.Text)

Catch generatedExceptionName As Exception
label1.ForeColor = Color.Red
label1.Text = "Offline!"
```

```
End Try
If logonServer.Connected Then
```

```
label1.ForeColor = Color.LimeGreen
label1.Text = "Online!"
logonServer.Close()
```

End If I tried to make it work for a port range but i failed... :(

Can someone help me to make this work for a port range?

Punkbastard - March 1, 2015, 3:17 pm

For a port range use a for-loop.

My quick code:

Code For portIndex As Integer = 1 To 5 'You could use two numericupdown's here for start-port and end-port (For port As Integer = numericUpDownStartPort.Value To numericUpDownEndPort.Value

```
Try
logonServer.Connect(ip.txt.Text, port.txt.Text)
MessageBox.Show("Connection Successful on port: " & Convert.ToString(portIndex))
Catch ex As Exception
MessageBox.Show("Connection Failed on port: " & Convert.ToString(portIndex))
```

Next

However, change your validation, as a label would not work right, try to add the logs to richtextbox or something like that.

It does work but it's the slowest thing ever made. :\

made. :\

That's because it takes time to connect. You could use multithreading to make it look more 'flawless' but I guess you won't get it much faster.

I did use threading, lol, it's important, i dont want to kill my UI. But it is slow, not the slowest thing but meh, slow.

If you want something better, write it yourself. Beggars can't be choosers.

I'm ok with it, i'll do some research to find out how this thing works.

omg are you a wizard or something? what is this magical place called Google?

OT: Seriously, resort to Google first. It prevents these silly posts on the forums and saves you a lot of time waiting for an answer.
