Thread: [\[PHP & VB.NET\] Encryption for php and vb.Net needed](#)

?MrRoot - March 4, 2015, 4:15 am

Hello,

So I'm trying to transfer encrypted text (no matter what encryption method) from a .net program to a php server to store in MySQL, I prefer something with only numbers & letters and it needs to be decryptable (not md5 or similar).

It's because when for ex. I transfer text using GET (It needs to be GET, not POST) and it contains stuff like ":" and "-" only half of the uploaded text is stored.

Base64 & XOR Didn't work.

So does anyone have any other encryptions and the code for it?

Thank you.

Get the raw bytes of the data you need to encrypt. Use AES to encrypt the data and convert them into UriSafeBase64 string (replace + with - and / with _). On the server side just use reverse process.

I have no problem with the + & /, I have problem with the "&" it deletes all text after the &

OOh you meant replacing the Base64 + and /'s? Okay sorry for my stupidity

Alright no nvm, I'm getting this error while converting in vb.Net to base64

What are you trying to convert to base64? The error is pretty straightforward.

The GET request look like this "url.com?data1=something&data2=something. "&" is used as a delimiter.

Alright, I was pretty stupid, I thought the error was from encrypting but It was a decrypt error (if an error occurs, it retries it in the decrypted state).

Just nvm, thanks for your help man, it's fixed.
