Thread: [How to bind a keylogger to an Image?](#)

Fractual - March 6, 2015, 11:15 am

Sorry if this is a very LQ post but I'd really like to know if it's possible to bind a keylogger to an image, any help is needed and if it's not possible please make that clear!

FRANKIE - March 6, 2015, 11:16 am

Search around on the forum for something called a file binder. I know there are a few floating around here somewhere.

I've done that but it keeps making the file a .exe not jpg etc

That's because a real .jpg can't be an executable.

If you want to make it look like a .jpg (but still is an .exe) you would want to try an extension spoofer.

Your best bet would be to change it to a screensaver(.scr) extension, change icon and bind an image to it.

you can use Jpeg exploit. to convert your exe file to jpg file. if the image file is viewed it downloads and executes your exe file.

this are not the kind of things you find here in HF. try some underground forums

Best piece of advice, I paid 40\$ once to learn this... .scr keeps the server an executable and might make it seem like a screenshot of some sort if you tell the victim it is. Of course change the icon with that and you've got a good final product.

godson1m - April 2, 2016, 9:06 am

I know all about keylogger i just don't know how i can bind it into a video or a picture and for it to actually work

You need a binder! You can bind an image with your executable! But make sure you change it from .exe to .scr! It's still an executable, but it might fool some people into thinking that it's a screenshot! Change to icon to a real screen shot of let's say your computer background, the victim will open in just out of curiosity, and bam! That's it!

simone91 - April 3, 2016, 8:18 am

putting the case that I'll put a .exe in a jpeg file, the .exe file (server of rat) will work with all the features I set in the rat ?? I say the features startup, hidden startup etc ...

yes i think, i've done that in the past with darkcomet and it works with the settings i've set like startup etc..

Sheeple - April 4, 2016, 4:31 pm

You need a file binder.

You CANNOT change an executable to .mp4 .jpg .png etc.

Only with exploits this is possible (and there aren't any public ones, and any ones won't be cheap)
There are .doc exploits which will change a .exe to .doc

B1N4RY - April 6, 2016, 1:02 am

Lol at all you noobs saying you can't use a JPEG.

<https://blog.sucuri.net/2013/07/malware-hidden-inside-jpg-exif-headers.html>

Username911 - April 7, 2016, 6:38 am

I once did it I changed the .exe to .jpg but omg I cant remember it

I'll keep you all aware when I remember I release the code
