Thread: [VB Gui, changing the gui design without changing the window?](#)

Chesso - March 10, 2015, 11:01 am

Is this possible?

For example say I had a gui on a page I want to be able to change the image (for example change from tutorial to play) This is just an example and doesn't relate but I don't want to have to have the use change the window they're using to use the program I'm writing, What can I do?[/align]

Hiiro - March 10, 2015, 11:46 am

Do you mean altering the GUI programmatically instead of the drag and drop designer?
I am lost.

Uhm, something like this?

The code below will change the image in a picture-box to the file you pointed the path at.

```
Code YourPictureBox.Image = Image.FromFile("C:\play.png")
```

Code YourPictureBox.Image = Image.FromFile("C:\play.png")
```

I'm not sure how to explain this, I've not got any code to show to aid in explanation.

But for example I create a gui called #main and I want to change to another gui so I could change the position of a button without having to open a new window.

In terms of GUI, do you mean a form?

Be as thorough as possible in future. That way, you'll get your answer far quicker. To move a control programmatically:

Code Button1.Location = New Point(10, 10) 'Move 10px each way from the top left XY axis

·**Evolved**· - *March 11, 2015, 12:33 am*

You could do that, or you could do tabs. I don't know which would be better suited to your purpose.

ElementalTree - *March 11, 2015, 8:50 am*

I'd recommend using a tabcontrol, you could also use panels to bring fourth the one you want to use and then hide the other one/s?
