Thread: [Deploy multiple OS's on multiple HDD's on one machine at once](#)

.Nick. - March 17, 2015, 4:24 pm

In my work place we currently deploy OS's to machines using a PXE boot service, with some pre-imaged machines.

Due to this not being a major task for my role, little development has been put into this process and currently we deploy a single HDD to machine at a time.

I was wondering if anyone knows of any solutions that will allow, for example, a single machine, that has had multiple HDD's that can all be deployed a OS at once?

I thought it may be possible if I had the same amount of NIC's to HDD's being installed on, then try and configured multiple instances of PXE using a Esxi host or VMWareWorkstation for small scale.

So, you basically want to image multiple HDDs at once?

Precisely, but in parallel at single location.

Unfortunately my company doesn't have a bundle of spare machines, so ghost deployment is out of the question.

If you have certain amount of cash, you could get a HDD duplicator.
