Thread: [\[DDOS\] Minecraft Server \[DDOS\]](#)

**GetRichOrDieTryingBO2** - March 28, 2015, 10:10 pm

Yo,

Can anyone help me? I tried to DDoS a server, I already tried XSYN, SSD and Spoofed SYN but nothing did work. I have the options:

Layer 4 Attacks:

Home Connections

SSDP

DNS Amplification

NTP Amplification

Spoofed SYN

Enhanced Spoofed SYN

X-SYN

TCP Amplification

Dominate

Valve Source Engine

Layer 7 Attacks:

HTTP-GET

HTTP-POST

HTTP-HEAD

RUDY

Slowloris

Source HEAD

Joomla Reflection

XMLRPC

And its not a big server it has like 15 people online a day.

I hope someone can help me

**Studxx** - March 28, 2015, 11:01 pm

What port are you using to ddos? How long? And how hard does it hit?

**Compression** - March 28, 2015, 11:03 pm

What is the server hosted

by????????????????????????????????????????????????????????????????????????????????????

**GetRichOrDieTryingBO2** - March 28, 2015, 11:17 pm

25565, 600 secs and I don't know what host but what I know that the server is only 2gb

**MentalWarfare** - March 28, 2015, 11:22 pm

It might have some good Ddos protection.

???? - March 28, 2015, 11:26 pm

Are you hitting the DNS..? Resolve the DNS to get IP.

**GetRichOrDieTryingBO2** - March 28, 2015, 11:39 pm

(Mar 28, 2015 11:26 PM)Scorpi0n Wrote: [\[CITE\]](#) Are you hitting the DNS..? Resolve the DNS to get IP.

How do I resolve the DNS? I only have the server IP: 88.150.136.78 port: 25565

???? - March 28, 2015, 11:41 pm

Try just hitting at port 80. Newb ddos protection will deflect attacks but only from 25565.

**HauntedPast** - March 28, 2015, 11:55 pm

Any luck, When i did it port 80 worked fine

**GetRichOrDieTryingBO2** - March 28, 2015, 11:59 pm

The server just doesn't go offline, you guys can't join because its a modded server.

And the owner told me it just has a standard newb DDoS protection that he host gives.

Anyone else that can help me? Its for educational purposes.

**GetRichOrDieTryingBO2** - March 30, 2015, 12:43 pm

Anyone else can help me? I really need help!

**Windows95** - March 30, 2015, 12:44 pm

Looks like someone is using inboot.me haha, anyways you simply need more power.

**mrifong** - March 30, 2015, 12:45 pm

(Mar 30, 2015 12:43 PM)GetRichOrDieTryingBO2 Wrote: [\[CITE\]](#) Anyone else can help me? I really need help!

Yes, i will try to do it i will do it , do you have a skype ?

**GetRichOrDieTryingBO2** - March 30, 2015, 12:45 pm

ProgramLogic u know a better booter?

mrifong, sorry I am not sharing my Skype send your Skype in a PM

**mrifong** - March 30, 2015, 12:49 pm

Well no problem :D add me on skype my user name is shtpmf

Alright took it out =] was pretty easy your problem is your powers just try a diffrent booter

?•?•? - March 30, 2015, 1:16 pm

I see you're using inboot.me. It has like 40 boots running at any given moment. It sucks and won't work.

**GetRichOrDieTryingBO2** - March 30, 2015, 2:31 pm

Anyone else can help me? I am using vdos now Method:SSDP SUDP NTP ESSYN HOME xSYN Quake ICMP TS3 TCP-ACK Dominate NetBios Joomla

**Hinch** - March 30, 2015, 2:37 pm

Two thing . Educational purposes my ass. Join HF for ddos help

OK so what booted are you using I presume you found it through Google searching booted and your using rage booter. I would recommend checker the IP address you resolved if they have a domain as some domains forward it to a server then to the mc server to stop ddos protection if that is the case then try to get a sort of hacked client that will display the IP address and for servers like that use ssyn and port 25565 but if he is using a shit host use port 80 as you may just be able to take the host down

With vdos I'm not sure tell me if I'm wrong use essyn

**GetRichOrDieTryingBO2** - March 30, 2015, 2:39 pm

A guy (mrfong) got the server offline with port 25565 with the same booter offline in 10 seconds but I don't know what method he used .\_.

Imma try SSYN

But wait, do you mean ESSYN or xSyn

Oh I see ur reaction; Use ESSYN, imma try it right now D:

It didn't work, I am going to try out port 80

It doesn't work :) I tried ESSYN with port 80 and 25565

**Hinch** - March 30, 2015, 3:01 pm

Ssyn is what I use for mc servers or UDP depending

**Bob White** - March 30, 2015, 3:04 pm

Most Minecraft servers these days have basic L4 DDoS protection of some variation.

You very likely will not be able to effect them with something as weak as a stresser.

You will need dedicated power from a vendor (like myself) or from your own botnet or many attack servers.

In short, you ain't got the power brosiiff.

**Charizarde** - March 30, 2015, 4:49 pm

Try and exploit a couple shells then ping the minecraft dns/ip. and boot the ip you have received the packets from.

**haxedsh1t** - March 31, 2015, 4:42 am

You sure you are hitting the right ip?

**GetRichOrDieTryingBO2** - March 31, 2015, 7:06 am

Mr Fong got it offline with chargen, SSDP and value source

**SIM-2198759** - March 31, 2015, 4:08 pm

Your booter might suck. (Use hornystress or another booter found on this forum)

Are you sure your hitting port 80?

Use SSDP.

Just a few ideas OP

**?Busted** - April 2, 2015, 5:05 pm

Its a free stesser or a paid one?

Im use Vdos and it good

**Raz3r** - April 2, 2015, 5:12 pm

Op, if you were still wondering I'd use SSDP.

If you've got a decent stresser they should include an "OVH" method, since most MC servers are hosted off OVH.

**System32** - April 2, 2015, 7:26 pm

Really depends and once you do do it it might take a while

**NerdNational** - July 5, 2015, 2:47 am

Well even a shit ddos protection can still do some thing to keep it up you may not be hitting it hard enough and do not just assume ever server runs on 25565 as that is the normal port for minecraft most hosts if not all hosts do not give them that port unless they pay for it as domains work better with it. so I would always aim for 80-53 first as a server is a server and inbound and outbound connects normally run though 80-53
