Thread: [\[GUIDE\] How to avoid browser password stealing \[ALL BROWSERS\] * Puush Incident 30/03](#)

Herbert - April 1, 2015, 6:33 am

Hi,

My name is John Herbert, during my time on the internet I have been safe to say, hacked only once in my lifetime. I avoid being hacked as much as possible, a common mistake people make is to enable saving their passwords, as you may know [puush has been infected in it's recent update \(r94\)](#).

in this guide I will teach you quick and easy how to secure if you were saving them in the past and disable saving your passwords to avoid future thefts.

Step 1.

Spoiler [\(Click to View\)](#)Checking if passwords may be stolen.

(Click on your browser)

[IE](#)

[Chrome](#)

[FireFox](#)

[Opera](#)

Step 2.

Spoiler [\(Click to View\)](#)If any password(s) have been shown in your saved passwords I would recommend deleting them from the list and changing the password for it immediately to avoid the account(s) from being compromised.

Step 3.

Spoiler [\(Click to View\)](#)Disable Remember Password.

IE: Internet Explorer > Internet Options > Content tab > Settings > manage passwords > Disable @ usernames and passwords on form.

Chrome: Chrome Menu > Settings > Show advanced settings > Passwords and forms section > Manage passwords > Disable @ Offer to save your web passwords.

FireFox: firefox menu > options > Security > Disable @ Remember Passwords for sites.

Opera: Opera Menu > Options > Privacy & Security > Disable @ Offer to save passwords I enter on the web.

Thats it!

And remember to never save your password for any browser.

Hope I helped,

John Herbert.

Luckily I never used Puush lol.. =z

Herbert - April 1, 2015, 12:58 pm

you never know, next time it may be flash player, just make sure you are safe!
