It decompiles without any reverse engineering needed, It's on the .NET framework. I was actually thinking of recreating this tool, but after looking through the code and using it I decided it was already good enough. I've searched for tons of instagram bots, this is the first one to ever actually work and have enough features to be of use.

From my time with google, I've found this program to be on various forums and various cracks of it. I'm not sure how legit this one is, but I'd sandbox it or run it in Virtual PC just to be safe.

? yw let me know how it works for you guys.

I bought this from a guy on HF ages ago. It worked for a bit and then crashed (on my pc that is...) well after that I asked for the updated version he completed and he told me i had never even paid for it. and he blocked me...

I didn't know this came from HF? I tried looking around for this and I found various forums having it. If he's on HF then someone can just close or remove the thread I didn't know.

Edit: The site for the program is down, there is only unofficial pages to get it from now. If he is on HF then he should see this thread and post on it to have it removed, if not it was probably somebody else just posting this like I did.

Looks risky Imaoo , why a virus detection?

Not entirely sure, it could be because of the functionality of the program. Or it could be a rat binded with the program so that it could be decompiled and viewed but still infect you because the rat is in C++ or something else.

Either way I wouldn't trust anything on internet. Always use a Virtual PC and or Sandbox it. Never execute untrusted / unknown programs without preparing to die, but that's just a rule of thumb.

I just bought this bot from instaget.info. It is the 2.0 pro version but I can't seem to get it to work. It says "login failed. Check connection and userdata." What am I doing wrong & how can I get it to work?

Thanks!

SimpleClix - April 6, 2015, 10:00 am
