Thread: [\[TUT Popular Hacking Terms & Meaning for Novice](#)

vampirictorch - June 12, 2010, 11:04 am

Hello, I have been reading the Tutorials just to brush up and get ready to start building stuff, However I noticed at the keylogger/RAT/virus tutorials; only talk about one program or one subject in most of them, so I will post here a tutorial

explaining all the important geek speak & asked questions for novice people, because if it is your first time using lets say a keylogger you would not know what "FUD" stands

for,
and this would cause you to post random topics no one wants to see called something like "WHERE CAN I FIND THIS" o

"GIVE ME A FREE KEYLOGGER!!!"

With this tutorial I hope to stop quite a bit of that, but I know it will never 100% stop haha.

Before you reply to this saying "You don't have alot of posts" or w/e along that line, I feel it is only appropriate to post when either helping people, or asking an Legitimate question, not to just say "Thanks" or one word posts, I read a lot of topic, but only reply on things i download & test.

Hope you Enjoy and I hope this Geek Speak tutorial helps.

TERMS YOU MAY FIND ON THIS SITE:

FUD = Fully Undetectable

Means they tested it as some mass Antivirus Website and it came up clean AT THE TIME, this in no means, means it is

clean when you downloaded it, because Anti-viruses (AV's) update all the time, so don't bitch saying "THIS IS NOT

FUD!!!!) just say "This is no longer fud for me, and post some scan as proof, most common scan site is

<http://scanner.novirusthanks.org> direct link to the scanner page

Cache

Here is a Quick Copy/Past of the Official Cache meaning, to explain it in better terms then I could by typing it.

Computer caches are memory circuits that serve to speed up a much larger memory drive. In a typical computer it

takes the microprocessor 60 nanoseconds to access the RAM. To cut the time it takes for the microprocessor to

access data from the RAM, a special memory bank or memory circuit is installed into the motherboard itself. This is

called an L2 cache and it can deliver the needed data in 30 nanoseconds, which is half the speed of the main

memory.

Cookies

A cookie is a txt file that you don't see unless you know where to go, and it stores valuable data for the use

i.e. passwords/usernames/websites/saved website data ect., so if you lets say find a keylogger or virus with the

option "Delete cookies" it makes there cookies go by by, so they have to re-login/have things remember there

name/pass this is so the hacker (You) could gather there data (Name/Pass)

USB Spread

Spreading in this manner is like if you have lets say a keylogger, your victim, does not know about, then you

enable the usb spread feature, if the spread feature works, then when they plugin a usb drive i.e. external

harddrive/ flash drive ect. it should inject itself onto the external whatever it may be. threw the usb.

Stealer

Stealers are when someone says something is a stealer they mean it intends to steal specific things as well as

other things i.e. google stealers mean they will steal google username/password, or steam stealers, steam

username/password, when someone says just "Stealer" and no details as to what they are stealing, it is always wise

to ask what are the functions of the stealer, even if they tell you it is a stupid question, for all you know it is

a stealer for your own info, a lot of people would not hesitate to infect there viruses onto members of there own

community, but most of the people that try an do that, do not know much about it and just want some victims.

Hook

A hook is an address that contains a JAL/J MIPS command which points to a routine, that is about all I know about

hooks, i do not use any function that I do not know enough about to say I know about it.

Antis

Antis, is when a keylogger has special features in it to get past a type of firewall or antivirus, this is very

useful when sending out a keylogger to make sure it has Antis of the most commonly use antivirus or FUD which is

explained above.

Test

in a keylogger more cases then not, there is a test button, what this does is sends your email a test email, to

make sure either your email is working properly and the keylogger is, now in most cases if you are from lets say

Australia, and use a strange gmail account, it will not go threw properly, if that is the case, have a member in

the us make you one and test it that way, or just go to www.gmail.com.

Build

builds the virus/keylogger/RAT/program you wish to infect the person with.

Screen Logger

When the keylogger is sent, a screen logger, takes an active picture of there computer at the time of sending, so

you could better get an idea of what they are up to at the time/ what is on there desktop/ anything of value, and

so on and so forth, several reasons for taking a screen logger.

Pumper

An pumper is a program where lets say if you have a fake windows update and it is only 5kb (Kilobytes) then

naturally people will find it fishy and not download it, a pumper, pumps it full of false data, to make it bigger,

depending on how big you want it, most pumpers only go up to 15mb, I seen some go higher but, then you risk

corrupting your program and then it won't be of any use.

ftp = File Transfer Protocol

an FTP is an thing to where you may upload/download files threw an ftp, ftp's at time are better then emails,

emails can get banned from mass emails overtime, ftp's could get banned, but only if you violate the terms, and

there are several ftp making programs out there, so you could lets say make a file on your computer into an ftp,

ftp/ip/folder/ect. ect. ect., and then you could have the data generated in a keylogger ect. to your home computer,

I have done that before manipulating the ftp feature, very easy to do, and several programs to do it if you

"GOOGLE" home office ftp setup

bind/binding

Binding is when you have one program (Your virus) and another program (What victim wants) and you bind them

together to make 1 program, so when they click the one program, your virus is released from the second program, and

for example, if you want Steam accounts, you would infect a generator of some type for a game on steam, if you want

diablo 2 accounts, you would infect a diablo 2 key generator/dupe program/ something to that extent, it is all

about what your victim wants, and not what you want to send them, like if you infect an photoshop7 don't hope to

get a steam account from it.

RAT = Remote Admin Tool

most RAT's (Remote Admin Tool) are legal, but the ones that can be sent in the form of a virus are illegal, one of

the most commonly used legal rats is Team viewer, I use it and I am sure SEVERAL people on this site uses it, it is very useful, a rat was originally designed to help people, or monitor what your kids/family does on the computer,

with a quick ctrl+key feature to pop it up to read logs, over the years they developed ways to do it from 1

station/Admin's room, and monitor all computers in the work station, now hackers use it to invade people's privacy,

they should of known what it would be used for in the long run ^^

Kill

A kill feature like mine, when they turn it on, it kills all there websites, to properly delete cookies, it just makes it kill a feature, like if it says Kill internet, it will make there internet say they are not connected,

a kill feature, just means it terminates/shuts off what ever the kill feature is directed at.

an great first timers keylogger location, but it does not seem to work on some countries gmails, so keep that in mind if you go doing it, there are several posts there from people in a country where the gmail is not accepted... not yet anyways [ISimples Keylogger](#)

But there are Several others, you could use for testing

Dykersoft - June 12, 2010, 11:14 am

Nice, I knew that when I joined HF I had no clue what an EOF is so I am sure that other people will find this useful. I don't think this will stop people from asking "can i haz phr33 stuff pl0x?", but it will help people understand programs more. Great Job!

The 7th Sage - June 12, 2010, 11:15 am

Epic tut for Beginners. Great job.

(Jun 12, 2010 11:14 AM)XHC Injection Wrote: [\[CITE\]](#) Nice, I knew that when I joined HF I had no clue what an EOF is so I am sure that other people will find this useful. well the only problem here is we have lots of stuff already.

Even with such tuts noobs don't "read" any stuff. They just want things to be given out or want the experienced ones to spoon feed them.

Dykerosoft - June 12, 2010, 11:16 am

(Jun 12, 2010 11:15 AM)The 7th Sage Wrote: [CITE](#) Epic tut for Beginners. Great job. Agreed, I think that it should be moved to the beginners section and stickied there. Of course with the addition of a few more terms.

But yes, sadly people do not read and they expect to be spoon fed.

vampirictorch - June 12, 2010, 11:23 am

@XHC Injection

yeah, I made it up in a few minutes, after reading a lot of people asking similar questions here, when if they do, it is always something they could easily google, but i guess google is too hard for most of them, as for posting it here yeah i would like it to be moved if an admin could, but i posted it here because I seen several guides here and most people skip the beginners section, and go straight for the program, and that is when they find several problems, then go to beginner section after they screw up there computer, that's the only way i figure people could be screwing up there computer so much, is by not reading how something works, so i posted this quick guide here hoping people will see the name and start reading if they do not know what it is.

so i intentionally posted it here in hopes admins might move it to the beginners section in the future, or mods.

The 7th Sage - June 12, 2010, 11:24 am

yeah i think it would be great if it stayed here.

[U]ltimate-[S]tylZ - June 12, 2010, 11:28 am

wow is very nice :) i think thats awesome ^^

-mothered- - June 13, 2010, 7:56 am

It's definitely a good guide for those who're new to this Forum, and need to familiarize themselves with the terminology of what most members utilize here.

Very Informative Indeed mate.

aveiro06 - June 13, 2010, 8:47 am

nice post , lets learn something

ch4x0r - June 13, 2010, 3:53 pm

great guide vamp very well explained this will help lots

vampirictorch - June 13, 2010, 4:22 pm

@ ch4x0r

Thanks, hope you enjoyed it, i should of posted pictures or some of them i should of made more details, but like i said previously, i posted it in a big rush.

@ aveiro06

Thanks, glad this could of been of some help, and glad to see people reading it :P

ch4x0r - June 13, 2010, 4:30 pm

yeah some pics would have been cool for alot but still good job

Teh Wallhacks™ - June 13, 2010, 5:51 pm

This was very helpful

Thanks
