Thread: [Mining Bitcoin using free tools on internet cafe and university lab computers](#)

neoXwave - April 8, 2015, 8:48 am

Recently i got into cryptocurrency and started mininig on my computer with no profit.

There are a lot of internet cafes in my region with large quantity of computers online around 12hrs a day and i was thinking if i could mine using them then may be i might get some profit.

People using the computer there dont usually put much stress on the computer so i was thinking of getting guiminer on all of them using a bat file to distribute to all and run it silently in background but this gives me no way to controll the miners remotely in case of problems so are there other software that run in console hidden and maybe provide some level remote assistance

Invest in mining rigs and cloud miners than using shitty home computers. They can bring you faster profits!

Bigandrewgold - April 8, 2015, 8:51 am

just look into silent miners.

But honestly, its not gonna be worth it. Likely the cafe will detect your virus before long, and even before they do you wont be making that much from the computers.

mixakg - April 8, 2015, 8:59 am

which mining rigs are best at the moment?

neoXwave - April 8, 2015, 12:08 pm

Thanks for the quick replies. I am only a student so investment in miners isn't feasible yet though I was only mining to act as startup for future investments and put of curiosity.

These cyber cafes here instead of antivirus mostly rely on deepfreeze software from faronics which I was able to bypass using another tool so I can infect one computer and have it infect others regularly using psexec tool

I'd recommend you to run a R.A.T on those computers, this way you can have complete access to the computers so you can get passwords, run miners, etc. A silent miner is limited and just gives a very low profit.

Do not RAT any university computer that is just asking to get caught and get into a lot of trouble

Sjenkie - April 18, 2015, 6:35 am

Be careful using these things.

I was lucky enough getting an email from my uni saying I might have some malware.

But actually was just hacking xD
