Thread: [\[TUT\]How to setup the Babylon RAT](#)

Powder - April 18, 2015, 6:38 am

How to setup the Babylon RAT

Introduction

Today I want to show you how to setup the Babylon Remote Administration Tool (Babylon RAT) with a DNS and without one.

For this Tutorial I'm using the newest version of Babylon (1.4.1).

If you don't know, if you have the newest version check the right corner of the GUI.

Which you can see here:

Spoiler [\(Click to View\)](#)

Preparation

DNS Part

Now you need to decide, if you want to use a DNS or not.

I would recommend a DNS, because it's safer than without one!

If you don't want to use it, you can skip this part. I wouldn't recommend using No-Ip, because it isn't safe anymore.

I can recommend [FreeDNS](#) and [DuckDNS](#).

I will show you how to set up a DNS at FreeDNS.

First of all we need to create a Account which can be done [here](#).

After you signed up you can start creating your subdomain. Just click on "Subdomains" or follow [this](#) link. Then you need to click on "Add a subdomain". Now you can create your subdomain.

Here are my settings:

Spoiler [\(Click to View\)](#)

Explanation:

Subdomain: You need to enter a name for your subdomain.

Domain: Choose a domain for your subdomain.

Destination: Here you need to put the IP you want to use "behind" this DNS (subdomain/domain).

VPN Part

At the VPN part you need to decide (again) if you want to use a VPN behind your DNS or not. If not, you can skip this part. I can recommend to use a VPN, because it "hides" your real IP. I can recommend [143VPN](#), because it has no logs and fast servers. If you want a more cheap VPN you can buy [RA4W](#) VPN, BUT I heard that they are/were unstable.

Main Part (Setting it up finally!)

Step 1: First of all turn off your Anti Virus and the firewall.

Step 2: Start the Babylon RAT.

Step 3: Add a port. You can add a port by clicking File, then Settings. You can find "File" in the top left corner of the GUI.

Step 4: Build a server. Remember to put the same key as the port key.

Step 5: Test it. If you want to close it easy, just uncheck "Hidden" and it will show a message in the right corner on the bottom.

Spoiler ([Click to View](#))

Here is a screenshot of my settings:

Spoiler ([Click to View](#))

Now you can test it. If you want to close it easy, just uncheck "Hidden" and it will show a message in the right corner on the bottom.

Explanation of the Builder tabs

Installation tab: [Screenshot](#)

Here you can choose if you want that Babylon should be installed on this system or not. It is used for auto start up on a system reboot too.

Process tab: [Screenshot](#)

Critical Process:

If the process is killed outside of Babylon it will cause a system wide crash.

Respawn Process:

If the process is killed outside of Babylon it will reestablish itself.

Instance Control:

Ensure there is only one instance of the client running running on the remote PC.

Other: [Screenshot](#)

Keylogger: Monitor your clients keystrokes both online and offline or watch your clients keystrokes as it types.

Changelog:

Code Changelog:

Date 05/12/2015

[FIX] Installer has been fixed.

[GUI] A status bar has been added to the Password Recovery.

[GUI] Added tooltips to the builder instead of text, "unnecessary clutter". Just hover over a particular feature and it will tell what it does.

Date 05/11/2015

[FUNC] Password recovery is remade, supports now Chrome, Firefox, IE, Opera and Safari.

[FIX] Remote Desktop has been optimized.

[GUI] Start and stop button has been merged together in the Live Keylogger.

Date 04/15/2015

[FUNC] Idle status added.

[FUNC] Uptime status added.

[FIX] On some PC's it kept spamming "A Babylon RAT client has been accepted and decrypted", this has now been fixed.

Date 04/12/2015

[FIX] Password Recovery now fully automated - do not support "Send to All".

[FIX] Taking screenshots is now fixed.

[FIX] Remote Desktop should no longer cause random crashes.

[FUNC] Keylog option now added to the builder.

Date 04/08/2015

[FIX] Save option in the builder is now working properly.

Date 04/07/2015

[FIX] Fixed parts of the remote desktop, still not complete as I still experience some issues but its rarely.

[FIX] Fixed Update function for mass sending.

[FIX] Optimized remote file explorer, still gonna make some further adjustments.

[FUNC] Added password recovery for chrome and mozilla firefox.

[FUNC] Added new password recovery tab, gather all recovered passwords with the ability to copy, clear and save all into a txt file.

[GUI] Adjusted the GUI for the builder, settings->networking & settings->Misc.Had a scaling issue on my laptop.

[FUNC] Added offline/online keylogger, enable/disable, check logs or delete current logs. Logs are stored on client side.

Date 02/24/2015

[FUNC] Monitor your clients keystrokes (UNICODE) from an inbuilt user interface. Start, Stop monitoring or save the current session in a .txt file and with the ability to monitor multiple clients at once.

[FIX] Minor fix in the Uninstallation feature.

[GUI] Minor GUI adjustment for the Chat box.

Date 01/29/2015

[FIX] The option Installation when building a client is now working properly (used for auto startup).

Date 01/22/2015

[FUNC] Added FPS to the remote desktop. You're now able to see the FPS while streaming.

[FIX] Minor bug for the creation of reverse proxies (Enable Authorization will now allow the textfield for username and password to accept inputs).

[DEL] Miner has been removed but will be re-added on a later moment with an update.

NOTE: I'm not responsible for anything I showed in this tutorial.

Cammy - April 18, 2015, 3:10 pm

I see you have put quite an amount of effort into this tutorial. Good work!

Powder - April 19, 2015, 6:50 am

Yeah it took some time, me and Gyo' invest. Thanks, I hope it helped you.

?

Powder - April 27, 2015, 5:15 am

(Apr 27, 2015 04:06 AM)Gyo Wrote: [\[CITE\]](#) Great tutorial Jennis. I will embed this into my sales thread. Im sorry for not having noticed this until now.

No problem. I'm happy it looks good to you. Thanks for putting it in your thread!

mrfong - April 27, 2015, 6:17 am

Looks like a great tutorial , and you did put some effort into it, thanks for this

OfficialNutty - May 3, 2015, 1:59 am

Do we have to download a client or anything for freedns? I set up everything and tested on myself and it works fine. But on the freedns site, when I click on "direct url" next to my domain, it shows me my real IP. Is it suppose to do that?

Dj Keylogger - May 3, 2015, 2:05 am

nice tutorial, thank you!

testkroket - May 3, 2015, 4:25 am

Nice work my friend!

Love the tut

Powder - May 3, 2015, 7:05 am

Love the tut

Thanks. I love to hear that.

iHasSlowInternet - May 9, 2015, 1:45 am

Hi!

I just bought Babylon but I can't get it to work.

It starts and everything but when I run the virus in a VirtualBox it doesn't show up in Babylon.

If anyone would like to help me I would highly appreciate it!

Thanks in advance.

EDIT: I haven't port forwarded since I don't know how. I didn't do it when I used DarkComet. Seems like I needed to open the port 15000 since I was going to use that port. So I started DC and added port 15000 then closed it. Then I went to canyouseeme.org and saw that it was open. So now I know that it works at least on my computer.

Powder - May 9, 2015, 7:36 am

Hey, hit me up with your XMPP or Skype. I will help you ASAP.

supahDupahMen - May 9, 2015, 7:51 am

Where can I get this "Babylon RAT"? :D

Maxman190 - May 30, 2015, 11:42 am

Apologies for stupid questions but, what do you mean by what IP I want to use behind the dns? My main IP? Also, for the VPN, is there a setting to use the VPN, or I just the VPN client whenever I do anything with RAT?

SIM-2362145 - May 31, 2015, 3:43 am

Nice tutorial will help out newbies.

Yes, the IP you use for everything in the internet. Also you have to put the VPN IP into the DNS settings. You have to start the VPN client everytime when using the RAT. Don't forget to change the dns settings if the VPN changes the IP.

(May 31, 2015 03:43 AM)Monetize Liker Wrote: [\[CITE\]](#) Nice tutorial will help out newbies.

I put the VPN IP into the dns setting on freedns, but the client isn't showing up. It shows up when I put in my main IP. I tried RA4W and 143VPN and Private Internet Access. Yes, I did run the VPN when using the RAT.
