Thread: [Really strange DarkComet RAT Issue](#)

Braindead76 - April 19, 2015, 4:26 am

Hello@all

First: Sorry for my not best english -

Hopefully somebody can help me here...

My DarkComet worked fine in the past... for a couple of weeks i changed my internet provider.
Also the router and my external IP Adress.

After reconfigured the portforwarding on the router and check my noip configuration the old slaves will connect the my DarkComet app. But not all of them.

Also when I try to connect a new slave (by testing on my own external machine) then I can see with netstat - the machine is forwarded to my master machine. But DarkComet wont connect. I have try with disable firewall / virusscan - The Port is open when I check with youcanseeme.org ... So I cant understand why the one of the external will connect and other wont ... and new slaves are not possible @all ...

Thank you very much for your Feedbacks...

Braindead

Have you tried another Rat? Darkcomet is very old and outdated.
Maybe try njRat and see if it works that way.

Ok, let me test with another RAT. What I can say, with the Workstations on my own Network is not working @all. But when I try for example the same "file" from an external Workstation with an external Network, the server will connect to my rat. So I cant test new created servers... But let me check with another RAT.

Thank you for help ?
