Thread: [Forcibly reinstall chipset?](#)

Barinade - April 19, 2015, 3:31 pm

I can't install my Intel graphics driver without using the chipset installer, installed the chipset drivers yesterday and everything was working fine then I tried to uninstall the graphics drivers again (Having switchable graphics problems) on both my integrated and AMD cards, which I've done before, but this time the chipset drivers installer isn't installing the graphics drivers - or anything - when I run it.

It opens, asks if I agree to a bunch of shit, then says "Successfully installed ..." etc. without ever doing anything. I check my device manager and the integrated device is still "Standard VGA Graphics Adapter"

I've done this before. Uninstall both graphics drivers, install Intel chipset, then my AMD drivers. It's always worked fine until now.

Any suggestions?

Edit: I've tried running the installer with the -overall argument, didn't work

Have you tried rebooting? If it didn't work, you can unpack chipset installer and try extracting GPU driver.

We need to know specs of the computer.

Publish a Snapshot using [Speccy](#) , taking care to post the link of the snapshot in your next post.

I just did a complete reformat.

Having an issue getting GTA5 to run on my graphics card, everyone else with switchable graphics is having the same issue. Shit port of the game problems.
