Thread is forever closed :)

Raz3r - April 24, 2015, 6:47 pm

Just go to walmart, and hide a laptop with wireshark open.

Then leave it there over night, take the .pcap file and get the credentials.

I've gotten alot of \$\$ from doing that.

Lamo why not just installed wire shark on the test computer and come back the next day and take the file?

Thats what I meant, just leave the test comp over night.

Then take it home the next day.

yeah you could do this, my suggestion would be to get a raspberry pi and run kali linux on it, with an alfa wifi card to run the wifi network, use karma (i think thats what its called?) to make devices automatically connect to it, and just run 24/7 sslstrip and ettercap to sniff passwords?

getting this to work in walmart would be a different story. you'd need wifi, but i guess most walmarts have free mcdonalds wifi you could piggy-back off of. then you'd need a power source. but if you somehow got your RPI sniffer hidden in walmart, powered and connected to wifi, you could also ssh into it from home and retrieve the sslstrip & ettercap logs.

just a crazy idea.

htuts - April 25, 2015, 12:20 am

you could connect the rpi to a powerbank, just wondering how much power the alfa adapter will drain from it.

code42695379 - April 25, 2015, 12:27 am

Yeah a powerbank would be good for going mobile, you can get some big batteries that can make the RPI run for however long you want. Wifi pineapple used to offer a pack that was meant for

leaving outside on top of roofs etc and was weather resistant and could run for 24-48 hours. But for a stationary RPI plugging into a power outlet would probably be best.

w34k - April 25, 2015, 10:26 am

Do what you want lol ? You won't get the plain text passwords just by using Wireshark, though.

yea my personal opinion a waste of time do what u want t ho

n3xus166 - April 25, 2015, 10:53 am

Tested this. 10'000 mAh power bank lasts ~5 hours with alfa wifi card and raspi b+
