Thread: [Hacking an email account belongs to Chinese server](#)

Pandora virus - April 25, 2015, 10:02 pm

Dear all,

I'm a very very newbie in this hacker forum. I'm trying to gain access an email account, which belongs to mail@163.com. It is one of the largest public email server in China. I have been searching over the internet for a legit hacker, even in the deep web. I have got an offer from one of the hacker, and they stated that:

Upon domain and LDAP, POP3 and iMAP analysis on their dedicated server, the approximate time will take is 5-10 hours upon payment.

Note that we do not crack emails using stereotypical methods such as bruteforcing, social engineering nor SQLi. WE penetrate the server stealthly using a 0-day exploit called wiper which plant itself directly to their reservoir without footprints in and out. In turn, it will extract a series of hashes from the specific targeted account with the corresponding IP addresses that the user recently uses/ frequently use. We will encapsulate the ip, cloned to a VPN tied to our own hosted server which you'll use to access. While doing so, the hashes will then be converted to a human-readable characters which is exactly the password of which means we don't change the original password that the victime uses.

Price : 1.890 bitcoins per account for this domain.

Time Frame : 5-10 hours max

Method : DIR INJ Multi LVL extraction

Does this sound legit to you? ?

bithuzb - April 26, 2015, 1:09 am

no, this sound very odd - better learn and try yourself obtain the password with a good crypted RAT/keylogger

Pandora virus - April 26, 2015, 4:57 am

Thanks for your reply. Do you know where I can get a good crypted RAT? I tried to build a crypted keylogger, but it does seem to work even on my own computer. It also looks very odd to send an .exe file for ppl to open. Are there any good keylogger which can be hidden in JPG, FUD and stealthy install after open the JPG.

Thanks
