Thread: [Click on button on another application from my application](#)

RedBull™ - May 4, 2015, 12:12 pm

Hello HF!

I have a program whose window name is = " Login " it has 2 text box , one is USERID and another is Password , one button with name Submit .

I want to create a program which will only click on Submit button nothing else .

Basically i just want a button from my application to communicate with button on another application .

Any help will be appreciated . ?

You could do it through injection maybe OR if the application has a web based interface, you can do it through getelementbyid in a webbrowser.

Exussit - May 8, 2015, 4:32 am

A dirty way of doing this without injection would be to bind a socket on each application and stream a string when you click the button on the first application, and when it de-serializes in the other application, if the string matches given parameters, then call the button.click convention to click the button in the second app :)
