If I know an iCloud accounts security answers is there a way I can find out the credentials without resetting the password?

Not really unless you have access to the phone or the phone is being used over a network you have access to. However, if you change the password all they get is an email that says their password has been changed that includes a link for them to change their password and some verbage that says they should change their password if this wasn't them. This means so long as you don't change the security questions or access their icloud with icloud for windows or via iCloud.com they likely won't suspect you've accessed their iCloud backup information.

I would suggest using something like what was suggested above or even Dr.Fone for iOS to recover the cloud backups.
