Thread: [\[C#\]\[Source\] Keylogger \(Also logs screenshots\) with emailer](#)

edgareatis - May 23, 2015, 5:00 pm

Simple little keylogger, will log key strokes and email the resultant logs to you.

Also attaches a screenshot of the computer at send time. VERY minimalistic but to avoid and scriptkiddys from exploiting this i have not included the code to hide the console. So a big black box appears when its running however this is a very simple feature to employ by anyone with even a basic csharp understanding.

This is designed to be built upon. The logger will log to any "LogStream" which is an interface i created within the project. LogFile is the class used in this instance which will log it to a file and email the file content periodically. At the top of this class you will find a place to include your smtp server settings.

(Side note, this has 1/57 detections so please do not abuse. I'm actually disappointed it wasnt a higher hit rate as this is like an hours work maybe a bit less with a few breaks here and there, very little work and only one hit. Antivirus companys have disappointed me)

Enjoy my fellow HF enthusiasts.

(p.s. looking to make a RAT sometime in the near future, this is one of the modules i am going to use in it but much more will be added, anyone interested in helping PM me) LOVE YOUUUUU

What?... Why are you disappointed that your program, that is very poorly written, no offense, wouldn't be detected by by anti-virus companies? Do you think that there is an abundance of shitty key loggers floating around that are spread on a large scale? If anyone came across this floating out in the wild they would probably laugh, and move on to some more sophisticated code that is actually worth their time.

Does this detect unicode characters with accuracy?

poorly written is an understatement haha but when a programs only features are log keys an email i

think any half decent heuristics engine should be able to detect it, which is how the 1 detection it got had detected it.

It only logs Character/Letter keys and the numbers along the top of the keyboard (simply because im lazy but could be implimented easily by changing the range of keys it searches for in the log class under the "GO" function.
