Thread: [Complete OSCestial RAT Setup Guide](#)

**Business** - June 11, 2015, 7:53 pm

This is a tutorial sponsored by "Specialists".

## Full OSCestial RAT Setup Guide

This guide was written to assist OSCestial customers with their setup process. I am not the owner/seller of this product, but I do not see any tutorials for it so I figured it would be helpful.

\*I realize this guide is designed for Windows users, but the steps are practically the same for all OS.\*

Before we get started, we must download the tools essential for this guide to be followed correctly.

I suggest saving these onto your desktop for easy access later in the guide.

What you will need:

OSCestial RAT (You should have purchased this already)

[Duck DNS Updater](#)

[Sandboxie](#)

Once you download these, you are ready to begin.

## DNS Setup

First thing we need to do when setting up Duck DNS is go to their website. You can find it below.

[Duck DNS site](#)

Next thing we need to do is sign in.

In the top right of the homepage there are multiple options for signing into Duck DNS, you can pick whichever one you prefer.

Once you sign in, you will be greeted by a page like this (I have blanked out certain parts of this thread for obvious reasons):

Next thing we are going to do, is choose a DNS domain name.

I suggest making your domain name something you will remember.

In the middle of the page, there is a place to fill out this domain name. You may choose whatever you want, then press "add domain".

Your DNS domain takes the place of your IP in the setup process. One of the main reasons we use a DNS is to prevent connection loss. If you use your IP instead of a DNS and your IP changes, you will lose all your connections. With a DNS you can access your connections from anywhere, and they will not be lost if your IP changes.

Now that you have made your DNS domain, you need to synchronize the Duck DNS Updater that you downloaded at the beginning of this tutorial. This process is very simple, just open the Updater on your computer, and find the Duck DNS icon in your taskbar. Right click it, then click the settings tab; a pop-up should appear. Go to the Duck DNS website and sign in. Once you are signed in, you should see a "token" (a bunch of random numbers and letters) towards the top of the page. Copy/paste this token into the corresponding field in the Duck DNS Updater.

Then, type your DNS domain into the first field and press OK. If you did this correctly, you will receive a pop-up message to confirm that your settings were successful.

## Port Forwarding

The next thing you will want to do is port forward. Every router is slightly different for port forwarding, so I am referring you to a site that has guides for port forwarding on all routers. Just find your router on [THIS SITE](#) and select it, then click the link in this paragraph to be brought to the proper guide:

To test if you have successfully forwarded your ports, you can use [THIS SITE](#).

type in your port where it says "What Port?"

If you were successful, you should automatically load this:

If your port was not successfully forwarded, you will get a message saying "ERROR".

If you DID get this error, DO NOT WORRY! There are many things that keep ports from forwarding.

Port Forward Troubleshooting:

The most common problem I see people having with Port Forwarding is Windows Firewall.

You can find this by either going to "Start", and searching "Windows Firewall", or by going to your Control Panel.

When you select Windows Firewall, you will see a page that looks like this:

The first thing you need to do is locate "Turn Windows Firewall on or off".

This can be found on the left side, in the middle. Click on it now.

You need to make sure none of the boxes are checked and that all options are set to off.

After you do this, the places on your screen that were once green, should now be red.

This is where the most common mistake comes in. Most people think that Windows Firewall is now completely off.

It is NOT! See where it says "Block all connections including programs on the list of allowed programs"?

You need to fix this.

The next thing you must do is find where it says “Advanced settings”.

Once you click it, you will be brought to this page:

You will notice that it still says “Windows Firewall is on.”

For your next step, click “Windows Firewall Properties”.

A pop-up will appear:

You need to change where it says “Block”, to “Allow”.

After you change it to “Allow”, hit apply. Then, change the firewall state to “Off” and click apply again.

Do this for all three tabs.

Once you have done this for all three tabs, press “Apply” at the bottom. Then press “OK”.

Where it previously said “Block all connections including programs on the list of allowed programs”, it should now say “Allow all connections that do not have an exception to block the connection”.

Now that you have completely and successfully disabled Windows Firewall, you can test to see if your port forwarded once again:

[TEST HERE](#)

Still having problems?

You may have a firewall enabled on your router itself.

Go back to the router homepage that we opened earlier and go to "Security".

Most router homepages will have that section.

Look for any firewall settings and make sure they are off.

If all the above steps fail, a last resort is using the DMZ option. Almost all routers have it. You simply enable DMZ within your router, and it will ask for your device IP. (internal IP) Enter it, and apply the changes. This puts your device outside of any/all firewall/security options that your router provides. This has proven to be a working last resort.

If you are on a wired connection, and cannot manage to open your ports, I suggest buying a VPN that supports port forwarding.

For this, almost any VPN will do. Just be sure to get one that supports port forwarding.

## Creating Your Stub

When you open OSC, it will look like this:

The first thing you want to do is listen to your port in the "Connected Ports" tab by typing your port and clicking "Add Port":

Next, head over to the "Compiler" tab and go to "Hosts", here you will add your DNS domain name:

**MAKE SURE YOU ENTER IT IN THIS STYLE:** yourdomain.duckdns.org

You will replace "yourdomain" with your actual domain name.

Ex: If your domain is "piratesarecool", you would enter "piratesarecool.duckdns.org" into the builder.

After that, go to "File Settings" and type your port into the builder:

I recommend using startup and Disable UI Element. All you need to do is check those boxes and enter your port. Once you are done, you now have a fully functional stub that is FUD. For questions regarding errors or issues you are having, contact myself or the product's owner.

If you are worried that it may not be working, you can use Sandboxie to test your file. Simply open "Sandboxie Control", and drag your stub into the box and accept the pop-up that appears. Once the file is running within Sandboxie, it should show a connection in OSCelestial if you have done everything properly. If a connection does not appear, double check that your firewalls are off and that your port is open.

If you made it this far, congratulations! You have successfully created a working stub that is 100% undetectable. The rest is up to you. Thank you for reading this guide, I hope it made the setup process much easier to understand.

**Incendiary.** - June 11, 2015, 8:07 pm

I must say OSC looks appealing, I might get it soon. Bookmarked this thread for when that happens.

**#Skyline** - June 11, 2015, 9:46 pm

Nice tutorial Business.

Haven't seen a tutorial on this RAT, and should be really handy to new users wanting to use OSC.

**Bo Burnham** - June 11, 2015, 10:46 pm

Nice tutorial as always :DDD

This will hopefully help some new members who are having issues with Celestial ;p

**afrO** - June 11, 2015, 11:16 pm

Great tutorial, it is well made and will be very helpful possibly to other's.

**Grim** - June 11, 2015, 11:54 pm

great tutorial business! always very helpful in the RAT section.

**xchg** - June 12, 2015, 1:55 am

Nice tutorial business

We can always expect HQ posts from you.

**DemigodRush** - June 12, 2015, 6:17 pm

Should I be waiting a few minutes or so for the token and website domain to work? Copy pasting the

domain and token, as well manually typing them I still get the error it wasn't put in correctly.

**Business** - June 12, 2015, 6:54 pm

(Jun 12, 2015 06:17 PM)DemigodRush Wrote: [\[CITE\]](#) Should I be waiting a few minutes or so for the token and website domain to work? Copy pasting the domain and token, as well manually typing them I still get the error it wasn't put in correctly.

Make sure not to put .duckdns.org at the end of the domain when syncing.

**bambam809** - June 12, 2015, 7:39 pm

Hmm, nice program. Going to buy as soon as I get it figured out.

When I click the Ducks DNS Updater link, I get the following page:

<https://gyazo.com/df23a46e3b13253b22943cd5ed9f7e8f>

I, of course, excluded my email, it just has this at the top still:

<https://gyazo.com/66bcf953d144f5b7058a6e2208054c5b>

So, I go to select my domain:

<https://gyazo.com/1f7286c14d8fb9ec585131aa67c041e0>

All that shows up is that random gibberish. So, I am wondering, what am I doing wrong? Is there something I am supposed to install on my computer on that page? I did not see anything to install. Should I do Powershell or Windows Script?

<https://gyazo.com/8ec25848943e8c674821ff626a1214dc>

<https://gyazo.com/2975ad2cc472ead33e3ada5113f826fb>

Thanks for the help! I am just getting my DNS and port forwarded before I buy the RAT tonight.

**Business** - June 12, 2015, 7:49 pm

Thanks for the help! I am just getting my DNS and port forwarded before I buy the RAT tonight. The part you are on is to download the program, not make your DNS. Just select the download link! :)

**on3s3lf** - June 12, 2015, 8:29 pm

Great work on the tutorial BTW.

**DemigodRush** - June 12, 2015, 9:37 pm

Hmm, still not wanting to work, I may be missing a basic step but as far as I can see i'm not doing anything wrong. i've tried making a new domain as well, all variations i've tried haven't seemed to work. TV?

**Business** - June 12, 2015, 9:38 pm

(Jun 12, 2015 09:37 PM)DemigodRush Wrote: [\[CITE\]](#) Hmm, still not wanting to work, I may be missing a basic step but as far as I can see i'm not doing anything wrong. i've tried making a new domain as well, all variations i've tried haven't seemed to work. TV?

What OS are you running? I can help on TV soon!

**DemigodRush** - June 12, 2015, 9:40 pm

I'm running Windows 7 I'll be leaving in 30 minutes but i'd be back 30 minutes after, hopefully we can resolve before I go.

**Business** - June 12, 2015, 9:40 pm

(Jun 12, 2015 09:40 PM)DemigodRush Wrote: [\[CITE\]](#) I'm running Windows. I'll be leaving in 30 minutes but i'd be back 30 minutes after, hopefully we can resolve before I go.

Just message me once you get back, then I will help.

**DemigodRush** - June 12, 2015, 9:43 pm

I can't pm you until I make another... 19 posts lol.

**Business** - June 12, 2015, 9:44 pm

(Jun 12, 2015 09:43 PM)DemigodRush Wrote: [\[CITE\]](#) I can't pm you until I make another... 19 posts lol.

Well then I guess either wait until then or post TV details here. (at your own risk)

**DemigodRush** - June 12, 2015, 9:49 pm

Haha will do once I get back; i'll just change my id afterwards, keep an eye out for me then.

**dennisv** - June 12, 2015, 9:55 pm

Business, do you have any time to help me trough TV aswel?

**Business** - June 12, 2015, 9:56 pm

(Jun 12, 2015 09:55 PM)dennisv Wrote: [\[CITE\]](#) Business, do you have any time to help me trough TV aswel?

I told him when he gets back because I should be available at that time, but I am not available for another 45 minutes or so.

**dennisv** - June 12, 2015, 10:03 pm

Allright, let me know when you're available

**DemigodRush** - June 13, 2015, 12:23 am

I apologize I got in an accident, had to call the cops to make sure he didn't try to flee so I got back late, maybe 30 minutes ago. Tomorrow I should have enough posts so I'll pm you then.

**1 Gun 2 Clips** - June 14, 2015, 7:24 pm

Why is sandboxie required?

**rm -rf /** - June 27, 2015, 4:03 pm

Thanks for writing this guide up, hopefully it can help out others who decide to purchase.

One thing to note as well - when port forwarding, if you get an error related to "connection refused", it's probably correct. The reason that it reads that error is because a program might not yet be listening into that port. When in reality, if you have the software running that is connecting to that port, it will read as "success". I know in the past it has happened to me once or twice and it took me a minute to realize it wasn't an actual issue. Just in case other members run into this and want an idea for something to look into.

The only reason I bring this up is because it's before the part where you run OSC.  
Good guide!

**Business** - June 27, 2015, 7:01 pm

(Jul 2, 2015 09:14 PM)Andrew Wrote: [\[CITE\]](#) Thank you for all your help one last question I already used a 3 number port is anything bad going to happen? No, but some people claim to have better

luck with 5 digit ports. If you want to switch over you can just:

1. Port forward the new port on 143 VPN
2. Listen to it in your RAT
3. Make a new stub with the new port
4. Update all your current clients with the new stub.

?

**kent0o** - July 16, 2015, 10:10 pm

Hi Business,

Please I need your assistance to help set me up. Have purchased and downloaded the SW (Rar Folder) but I can't seem to find the main folder where to launch/run the program. Pls help.....!

**Cloud Wolf** - July 25, 2015, 4:41 am

Could use some help, I'm wondering how do you get a mac user to install the stub? I tried sending the Stub.jar file to my mac computer and first it won't let me open the file unless I allow installation of non-mac store apps in the security settings, then when I do that it just gives me an error that says it can't run and it doesn't connect as a session or client in the oscelestial gui. Anyways any help would be really appreciated as I'm fairly new to this anyways :)

**LORD OF FULL\$** - July 30, 2015, 2:17 pm

THANK YOU SO MUCH BRO.... I AM GOING TO CHECK THIS OUT BRO.... :d

**DemigodRush** - August 7, 2015, 3:55 pm

Anyway to keep all my slaves? Every time their computer restarts I lose the connection as well if I restart my computer they're lost even after reconnecting to the port and duck DNS.

**XuidDump** - August 7, 2015, 6:36 pm

(Aug 7, 2015 03:55 PM)DemigodRush Wrote: [\[CITE\]](#) Anyway to keep all my slaves? Every time their computer restarts I lose the connection as well if I restart my computer they're lost even after reconnecting to the port and duck DNS.

Just going to state here that the OSCelestial stub is very obvious which could be one of the reasons why you're losing your slaves.

They probably:

- End your Rat's task through Task Manager.
- Remove your Rat from their startup.
- Reformat their computer.

Also, OSCelestial is somewhat known for it's common stability issues which might be why you might be losing slaves.

Anyways, I'm not hating on OSCelestial in any way because I personally have bought it and use it often.

I'm just saying that Java isn't the ideal programming language for Rat's, so you can't really expect much better.

That being said, we can only hope that Zakary works on making the OSCelestial Stub not lag your entire computer which would make it a lot less obvious.

--

Once you get 20+ slaves, you don't even feel the stability issues to be honest, so it's not really as big of a problem as it seems.

Some trouble shooting / information for you:

- Make sure your port is open and OSCelestial is listening to it.
- Make sure startup is enabled when compiling your stub.
- Don't use Duck DNS because it's a honeypot network. Use afraid/free DNS.
- Test your stub on yourself, and see what makes you disconnect, or check when.

--

Hope this post helped / answered any questions or concerns that you've had.

**?Cyber** - August 7, 2015, 6:37 pm

Might want to remake the DNS part of this as DuckDns is no longer recommended (honeypot)

**tietiekel** - November 9, 2015, 2:00 am

friend :) thanks for the info)

**MELLOW.** - December 5, 2015, 7:05 am

What would be the best free alternative to no-ip?

**fxb0t** - January 3, 2016, 8:45 am

Just paid it can you help me to compile it ?

Because in this tuto you just say "open osc" but no executable file

If you can help me it will be very very very helpfull

**layzie0099** - January 15, 2016, 7:47 pm

I have not been able to use my OSC for a while after I bought it and I have emailed you guys several times including Zakary but you pair dont want to reply me and I tot you offered support to your customers... i cant recommend or get new one if the support is DEAD!

(Jun 11, 2015 07:53 PM)?usiness Wrote: [\[CITE\]](#) This is a tutorial sponsored by "Specialists".

Still having problems?

You may have a firewall enabled on your router itself.

Go back to the router homepage that we opened earlier and go to "Security".

Most router homepages will have that section.

Look for any firewall settings and make sure they are off.

If all the above steps fail, a last resort is using the DMZ option. Almost all routers have it. You simply enable DMZ within your router, and it will ask for your device IP. (internal IP) Enter it, and apply the changes. This puts your device outside of any/all firewall/security options that your router provides. This has proven to be a working last resort.

If you are on a wired connection, and cannot manage to open your ports, I suggest buying a VPN that supports port forwarding.

For this, almost any VPN will do. Just be sure to get one that supports port forwarding.

## Creating Your Stub

When you open OSC, it will look like this:

The first thing you want to do is listen to your port in the "Connected Ports" tab by typing your port and clicking "Add Port":

Next, head over to the "Compiler" tab and go to "Hosts", here you will add your DNS domain name:

MAKE SURE YOU ENTER IT IN THIS STYLE: yourdomain.duckdns.org

You will replace "yourdomain" with your actual domain name.

Ex: If your domain is "piratesarecool", you would enter "piratesarecool.duckdns.org" into the builder.

After that, go to "File Settings" and type your port into the builder:

I recommend using startup and Disable UI Element. All you need to do is check those boxes and enter your port. Once you are done, you now have a fully functional stub that is FUD. For questions regarding errors or issues you are having, contact myself or the product's owner.

If you are worried that it may not be working, you can use Sandboxie to test your file. Simply open

"Sandboxie Control", and drag your stub into the box and accept the pop-up that appears. Once the file is running within Sandboxie, it should show a connection in OSCelestial if you have done everything properly. If a connection does not appear, double check that your firewalls are off and that your port is open.

If you made it this far, congratulations! You have successfully created a working stub that is 100% undetectable. The rest is up to you. Thank you for reading this guide, I hope it made the setup process much easier to understand. (Jan 3, 2016 09:45 AM)fxb0t Wrote: [\[CITE\]](#) Just paid it can you help me to compile it ?

Because in this tuto you just say "open osc" but no executable file

If you can help me it will be very very very helpfull

Still need help?

OSCelestial support is DEAD

**In\_Case\_You\_Need\_Help** - March 20, 2016, 4:57 pm

which crypter is best used for this ?

**Peter1\_1** - December 19, 2017, 10:22 am

Where may I purchase OSCelestial Rat?

**Sheeple** - December 19, 2017, 10:34 am

**NOVA** - January 25, 2018, 5:35 am

what happened to the Oscelestial rat?

**SlowMehMo** - April 28, 2018, 3:44 pm

What good is rats anyway? just learn to code and you wont need to backdoor people.

people are thinking that rating is away to learn to hack, it will not teach you anything other than how to be

a super huge skid, which you get arrested eventually.

I think that if someone cant figure out how to port forward or disable there own damn firewall, then the last thing they should be doing is RATing.

Just as a note, if you would to try to RAT me i will simply reverse your trashware and exploit its networking functions to turn you into a slave,

meaning you being completely destroyed in more ways than you can imagine. and no it cant be patched or fixed, All remote software is vulnerable to that, no matter how its coded or what who when where, doesnt matter, RATs are essentially just a go to prison hack. Oh and i can bypass VPNs with exploits as well so that wont help you.

But if your hacking dumb people who dont understand simple networking than you wont get caught, but you wont get anything useful either, its not like your going to hack there bank, or steal any money, or that you can use them for botting, since if you stopped handing out malware and learned to code instead of sucking ass then you could actually do those things by yourself. instead of backdooring people to make yourself feel better about the fact that you cant program.

obviously you will have something to say about how im wrong, and -rep me or whatever, but that wont change the fact you are part of the cancer, and you cant even code because your not smart

enough, but you want to be leet anon man, which is a definition of a skid, and literally the sadest thing i have ever seen on hackforums, the facilitation of skiddery, from skids who cant and never will be able to learn anything.

This does not apply to all users, since some are actually decent people, but that is 1 out of 100.

Your own, if you cant code one then find something better to do.

(Jan 15, 2016 08:47 PM)layzie0099 Wrote: [\[CITE\]](#) I have not been able to use my OSC for a while after I bought it and I have emailed you guys several times including Zakary but you pair dont want to reply me and I tot you offered support to your customers... i cant recommend or get new one if the support is DEAD!

OSCelestial support is DEAD

well learn to code, instead of getting scammed by crappy scammers, at least get scammed by me, at least i make it entertaining.

if you cant make your own RAT then dont RAT people. because you dont deserve it and because you dont know what your doing

if you can code your own, then how did you not see this clear obvious scam?

(Dec 5, 2015 08:05 AM)MELLOW. Wrote: [\[CITE\]](#) What would be the best free alternative to no-ip?

ask your local police, im sure they can help you....

there is none, stop cheapskateing everything.

Do what? Talk about what? i made my point already, what you said was hypocritical.

i put out some bait to catch edgy kids who spend there allowance to backdoor random people, and you took the bait, and now im doing other things, no offense, but my work is done here.

Im sure your a valuable user in some way or another. ?

You realize not everyone uses RAT's to backdoor random people right?

Or is your cerebral capacity maxed out and not able to think that much?

(Apr 29, 2018 08:07 AM)???t? Wrote: [\[CITE\]](#) -snip-

i do know that, i used RATs to monitor employees,

why do you need a silent admin tool and you want to crypt it.

Idk what you plan on using it for, but if your using it as a backdoor then your just a sad person, lol you can make all you childish insults but the fact is, i can make a C++ RAT because i have big brain your buying garbage that gets shut down because you cant code. thats all, now im done talking to you, lol so im ignorelisting because your so offended your not going to hush up because you have a superiority complex that enables you to run into battles you cant win. Get roasted, and blocked
