SYSLOGGER Keylogger Tutorial by Dread Pirate Robert's

Hello! In this small tutorial i will "talk" about Syslogger Keylogger. I will try to explain every option on the program and all the process.

LET'S START!

Above, we can see the first thing that shows up, when we open Syslogger. Just Press OK, so we can continue

The program will open, and we can see many, many options. We will talk about them step by step.

As we can see, in the top right corner, we have fields to fill with our e-mail information. Just fill it right and press Test Mail.

If you fill up everything correctly this box will show up:

If you want to get logs in a FTP server, just fill it up, and test it. And you are good to go!
Now that you set up the way to get the logs, lets configure the server itself

So, in all my servers i activate this options:

Antis

Encrypt Mail

Delete Cookies

Block AV Sites

Kill Task Man

Clipboard Logger

Force Steam

Basically, what the options above does is: Block the Task Manager (Kill Task Man); Everything that you copy like CTRL + C get's on the logs (Clipboard Logger); Forces the client to log into steam (Force Steam); Deletes the Cookies of your Browser (Delete Cookies);. There are more options that you can activate like USB Spread and Startup (USB Spread, is a spread when you insert your USB Drive) (Startup is when you turn on the computer the keylogger will start automaticaly), but i dont like to activate them, they are too bad! :D

The Error is activated is a small window that shows when you open the keylogger. You can configure it so say something that you want.

Example:

After making all of this just click Build Server! :D

Now you should get your keylogger successfully in the folder that you choose to save it.

YeyeYeyeYeye

After this is simple, just spread it, in your school, office....

Conclusion

Now i think that you will be able to send a good keylogger to anyone that you want. Any further help don't hesitate to reply or PM me. Thank you in advance.
