Thread: [Autolt Image Search](#)

Help!

Can someone tell me how I would ask my program to search for an image eg an icon on my desktop. Then for it to move your mouse over the image and click it.

Or can you do it so that it just automatically clicks the image without moving my mouse.

Thanks

Are you really needing it for that scenario? If the file exist then execute the short cut. If you are needing it for something else and that was just a example, you get a checksum match on a position/area of the screen to match a checksum you have already taken previously when the checksum match then obviously that means the picture/checksum is displayed.

im on my phone and it's hard to explain but I also feel you could be more clear about what your trying to achieve. I would think there's much easier ways to do things. If you are doing something like a poker bot you will almost always want to set a start position get the checksums of seat positions of empty seats. When the bot goes to a room it checks the seat positions for the matching checksum if the checksum matches the empty seat checksum taken from earlier then the seat is empty. There's always ways to cut your search times down which can be important.
