Thread: [Gmail password hack anyone?](#)

ervlicz - June 21, 2015, 5:21 pm

Hey guys... i jus wanna know...

Is there any gmail password hack that really working? i've already tried everything that said it can but i haven't found one yet...

Any tips or suggestion?

Or at least please tell me how to hack it...

thanks

puff puff - June 21, 2015, 5:35 pm

Sorry to inform you,

but there is no magical program click-to-hack to instantly receive passwords.

My suggestion is to stop looking for one immediately before you download some fake ass RAT and get your computer pwned.

Russell Peters - June 21, 2015, 5:37 pm

I am not sure but I heard there is this program called Hydra. You should check it out not sure if thats what you want but go give it a look maybe thats what you need.

Armada - June 21, 2015, 5:40 pm

The 2 best methods to Gmail or any email cracking are still: Straight up brute forcing the users password

Social engineering and luck of the draw trying to guess the security answers to the account.

ervlicz - June 21, 2015, 5:41 pm

hmm... i really wanna know how to hack gmail... not for bad intentions... just wanna know did my girlfriend was cheating on me... any suggestions so i can learn how to hack it?

puff puff - June 21, 2015, 5:46 pm

I your actually looking for trying to access the account rather then those fake "gmail hack v1.2 FULLY WORKING 100%" bullshit this is what you need to know:

Gmails are quite easily accessible to get into with a little social engineering on your target
Brute forcing, takes awhile and not always successful
Keylogger and RAT (once again social engineering)
Phishing

...some other methods but these are your main ones

Does she live with you and/or you have access to her computer?

If shes on your wifi then getting into her email is a breeze.

ervlicz - June 21, 2015, 5:47 pm

yeah... i know that already... i wanna learn this brute forcing... is there anyone can teach me?

no... she doesn't live with me... but iwas curious... since she change her facebook password recently... before that we are open about anything...

Brute forcing used to be much simpler years ago. Now the problem with brute forcing is finding a good web based brute forcer that can support Proxy services, and ability to bypass the security end points from the server (Gmail will start prompting for captcha and other such lock out measures after X number of failed attempts.)

Its been a while since I did any of this, but I have noticed a few decent looking web based crackers in the market place, maybe read through the reviews and find one where people have verified it working with Gmail.

Sorry to tell you all this, but your information is out of date. I recently made an attempt at brute forcing a series of gmail accounts. Google has implemented new security that detects bruteforcing and dictionary attacks. To counter it, instead of just simply closing the connection, it starts returning "success" packets, (authentication success flags) in response to ALL password entries. Therefore, every single attempt in your bruteforcer returns that it has resolved the password...all 1000-1 billion of them. It doesn't seem to matter if you use a proxy list or multithreading...still no success from my end.

It's quite ingenious really... it's got me stumped. XD

:-/ No kidding huh...

Figured Google would implement something like THIS to screw with us all... ?

dang it... so there is no other way to hack gmail now?

puff puff - June 21, 2015, 6:01 pm

Yeah, that's the reason ive never brute-forced because when I tried to start, well, I simply couldn't because of failed proxy's and gmail is 2 smart 4 dis.

@OP if shes living with you, you have physical access to her computer at sometime, or shes on your wifi theirs some tuts around here on hijacking(cookie injection), making a RAT and when shes cooking dinner or something plant that shit into her PC, or use MITM attacks on your wifi and sniff saved passwords/virtual keylogger.

ervlicz - June 21, 2015, 6:03 pm

yeah.... we lived in different town... since i got some job on the other city...

Jokerzz - June 21, 2015, 6:04 pm

I think the best choice is a password combo list.

puff puff - June 21, 2015, 6:06 pm

You could social engineer her into installing your RAT.

Either that or guessing security questions is going to be your best bet.

Phishing could work but it requires master SE to pull off, and the target has to be pretty gullible...

EDIT: make your stub, crypt it, bind it with skype (or dont bind it and name it like CamNowv1.4)

and say "hey, wanna video chat?"

"yeah sure!"

here make an account my name is burgereater446 add me here is the video chat download :
YOURSTUBHERE.exe
DEFINITELY not the best way of going around this but just my 2 cents

It is best to always read some tutorials before attemptint to use such software, there is a good possibility you could ave very well infected yourself with base copy of the server itself if you are unaware as to what you are doing, I highly recommend searching out a couple tutorials on configuration for the RAT you have chosen.

Alternatively I know there are quite a few members who offer Mentoring services for this type of thing. Business and Hitman are both good members for this type of thing.

thanks dude... idk what to do...
