Thread: [How to get Wifi Passwords stored on machines ?](#)

Hackoo - June 23, 2015, 10:53 pm

Hi ?

Did you know how to get the Wifi Passwords stored on machines using batch ?

I made before an hybrid code [Vbscript/Batch] to do that and is tested only on french machines and on windows 7 32 bits ! (I will post it later)

So this batch works for the moment only on french machines, so i'm looking for some help to improve it for working it on all machines !

Code @echo off

Color 0A & Mode con cols=65 lines=3

Title Profils with Wifi Passwords Keys - By Hackoo

echo.

Echo Please Wait ... Export Wifi profiles is in progress ...

netsh wlan show profiles | Findstr /i "Profil" > Profiles.txt

for /f "delims=: Tokens=2" %%a in (Profiles.txt) do (netsh wlan show profiles key=clear name=%%a
>> Profiles_WifiTmp.txt)

Cmd /U /C Type Profiles_WifiTmp.txt > Profiles_Wifi.txt

Del Profiles_WifiTmp.txt & Del Profiles.txt

start profiles_Wifi.txt

So please let me know if somebody here will work for him or not ? ?

Thank you !

I wonder why it only works on French (based) machines, that's very strange. Also, the script looks wonderful and it's quite scary knowing a Batch script can obtain your WiFi network password, in let's see? 9 lines? Good job OP and good luck.

netsh wlan show profiles | Findstr /i "Profil" > Profiles.txt

that's why.

You need to change Profil to be in other languages or whatever.

That's purely an assumption though, and will take my inspection to validate.

Hi ?

I think that i found a workaround for this code. Try it like this :

PHP Code

```
<?php
@echo off
Color 0A & Mode con cols=70 lines=3
Title Profils with Wifi Passwords Keys on Windows 7 - by Hackoo
echo.
Echo    Please Wait ... Export Profils with Wifi Passwords Keys ...
Timeout /T 2 /NoBreak>nul
Set MyWifiKeysFolder=My_wifi_keys
If not exist %MyWifiKeysFolder% MD %MyWifiKeysFolder%
cd %MyWifiKeysFolder%
netsh wlan export profile key=clear >nul
Explorer "%~dp0%MyWifiKeysFolder%"
msg * Your Password is in keyMaterial TAG.
```

Please don't forget to leave your feedback ? ? ? ?

This is a hybrid code [\[Vbscript/Batch\]](#) to get all informations about Wifi with their keys of course animated by a waiting bar in HTA that looks like this screeshot :

[img]<http://nsm08.casimages.com/img/2015/06/24//15062403211511244313394265.jpg>[/img]

So to get it working, just copy and paste this code below and save it as [WLan_Infos.vbs](#) and run it by double click ? ?

gogglebot - June 24, 2015, 2:19 pm

This line alone shows the password for a specified SSID that you've previously been connected to (along with all the other details about that connection) Code netsh wlan show profile name="somename" key=clearOf course you'll need to know the SSID of the connection, you can get a list of the SSID's from this command:

Code netsh wlan show profile

You'd probably need to write the output of that to a file and use findstr or use a for loop on the output to locate the SSIDs, then put them as a variable and put that into the name slot in the first command I listed.

annikk.exe - June 25, 2015, 12:38 am

Nice script Hackoo :> I had a brief try on the computer I'm currently using but it doesn't have a wireless card so it didn't really work.

Code C:\Users\admin>netsh wlan show profiles

The Wireless AutoConfig Service (wlansvc) is not running.

evarand123 - June 27, 2015, 11:41 am

i dont know where it shows the password
