gorenlars - June 24, 2015, 6:58 pm

title says it all

Willing to pay for nullify

bubi.n = skype

Nachoss - June 24, 2015, 7:05 pm

I would recommend going to Chickenmelon about this.

"nullify" nfo.is easy to null don't pay money to down a single shitty nfo server buy a alot of vpses that.spoof.find a payload that nfo doesn't.have entirely blocked.and.null

Lol what? This makes absolutely 0 sense what so ever.

@ OP, I can do NFO nulls \$5 each any location. I'll contact you.

Oh but weren't you just telling some member that there easy it's not worth \$5 but 0.30 cents y u ripping this poor mayn off bra what I mean with alot of vpses and a method that isn't blocked that easy you can null nfo servers

PLT ? - June 25, 2015, 3:22 pm

It's called supply and demand.

Get a grip pls.

Honestly only an idiot would pay \$5 for a shitty game server that no one cares about to get nulled for 4 hours

People were previously paying other members \$15.

I advertise them off-site and I get people swarming to me for them all the time.

Also, if finding methods that isn't blocked by NFO is so ridiculously easy then I challenge you to find one in 48 hours and prove it can consistently null an NFO server.

It doesn't even need to last more than a few days. Now, go. Show me.

Ts3 with 1 server you can hold it down for abit most of there servers now have 5-7 servers running that on individual lists and nfo will flip out and null

I've tried TS3 on multiple of my own NFO servers and they get blocked instantly.

But sure, if you want to spend hundreds on multiple servers just to down a few NFO's be my guest. It'll be the same as any other amp method.

Cause you're probs using 1 false advertised port speed server you just need 4-7 cheap vpses that

can do 1gbps which would cost around a dedi and you can null nfo if they're on individual lists try it yourself

PLT ? - June 25, 2015, 3:33 pm

It's funny considering if you're not even running a TS3 service then it will be like any other amp method.

And you also proved my point. Go spend hundreds on multiple servers just to down an NFO. Nah thanks m8.

Also, NFO has an extremely high mitigation capacity for amp methods. It's a lot less with raw UDP.

pgorangeman - June 25, 2015, 3:34 pm

Sorry but you're not doing shit with shared resources. Hence "VPS".

Lmfao I know of one host that does exactly 1gbps before amplification

PLT ? - June 25, 2015, 3:39 pm

I'm having extremely high doubts that you have full 1Gbit ports on multiple VPS's, being able to not only spoof and amplify the full port, but do it without getting all your servers suspended within 24 hours.

pgorangeman - June 25, 2015, 3:41 pm

Had this server for 3 months nothing special most foreign hosts really don't care about that kind of stuff

KVM or OpenVZ?

Is this a public host?

I'd like to verify your claims.

KVM you can't run spoofing scripts on openvz drops packets, and no the host isn't public

I've done so before I believe. It was probably a modified kernel now that I think about it actually.
