Thread: [Vb2010 Code Help?](#)

Lexxi - June 29, 2015, 8:36 am

ok so there are macro recorders and send keys stuff right? can anyone help, im trying to make the send keys or create a macro recorder which will only work within that application not repeat outside the application so i can open a few of the forms up and play the movement instead of being able to only run one of those programs because the replay would just repeat what i did. i need the repeat to be inside the program not just send it it needs to be sent inside itself. can anyone help? thanks in advance. atleast the sendkeys within the program or how i can have a macro recorder or create one which will work within the program. so to clear it up. i run a game and play a macro of it. which is only one because if i open a new tab with the game it will interfere. so if it sends in the program (has webbrowser for website) i can open the application many times and repeatedly run the send keys or macro recording many times at once.

Well your wording is extremely confusing but I am getting an idea of what you mean.

This following article is strictly talking about sending the tab key, however you can use it's info as a way to learn how to send keys to a certain window/application: <http://stackoverflow.com/a/13150233>

It's very difficult to understand you, I was only able to pick out a few things from this. Are you talking about making it single instance? We had a discussion on that the other day. There's a checkbox in the properties for this.

Tedd's link is what you need for communicating with other applications.

yep the link is what im after but i record a macro to replay my movement. is it possible to play a macro which info of it is sent to a specific application? for eg whatever was inside that programs border is played as macro so i can minimize and have the macro running so this way i can open multiple firefox browsers and multiple accounts and have multiple of those macros running. my goal is to just run the macro multiple times during that one period of time. if no luck with macro, using link i might use a hole paragraph of sendkeys which will be the same as the recorded macro but have it sent to a application not just send to whatever u got open

This following article is strictly talking about sending the tab key, however you can use it's info as a way to learn how to send keys to a certain window/application: (cant post link here - need 50 posts) yep the link is what im after but i record a macro to replay my movement. is it possible to play a macro which info of it is sent to a specific application? for eg whatever was inside that programs border is played as macro so i can minimize and have the macro running so this way i can open multiple firefox browsers and multiple accounts and have multiple of those macros running. my goal is to just run the macro multiple times during that one period of time. if no luck with macro, using link i might use a hole paragraph of sendkeys which will be the same as the recorded macro but have it sent to a application not just send to whatever u got open

```
((Dim destination As IntPtr = FindWindow(Nothing, "TestForm"))))
```

thats what im after but have it autopilot. so i can minimize the application but it'll still be sending and doing the task i need while minimized so i can run more of the application with more browsers. basic goal is have the info sent inside a application or and mine. be able to have multiple if the application running having multiple browsers open. i play a game and repeat a task using macro and i have a virtual machine opened to run it through that so i have 2 macros running and 2 accounts. i want to be able to run as many macros (in this case send keys) running in the same time so i have more than 1 account repeating the task in the one screen instead of running a virtual machine to run another macro and acc)
