Thread: [Steam Accounts app + source](#)

Illusionisten - July 1, 2015, 9:05 am

Ye so... It's nearly +35C! My head is getting hotter&hotter so I just made something since I've multiple steam accounts and I get a headache while thinking about it. I think a lot of HF have as well.

How it works:

1. Start Steam Accounts.exe (does require admin)
2. Add all your accounts (they'll be saved in a .xml file)
3. Choose which acc you want to use and hit the "Login"-button

Note: it does not matter if Steam is already running or not

[DL: Application](#)

[DL: sauce](#)

EDIT; funny seeing people download the source and not even saying thanks, almost as if they would hope the thread to get burried so they can hustle some skids.

Hiiro - July 1, 2015, 7:20 pm

What does this program even do?

Jordan "ESEA" Belfort - July 1, 2015, 7:23 pm

This could be very useful, Thank you for releasing this.

It lets you switch between Steam accounts easily.

?Dødøsky - July 2, 2015, 6:01 am

really good program specially if you have lots of accounts with different games inside

evarand123 - July 2, 2015, 8:26 am

Cant you just switch feom the steam app

Dickface - July 2, 2015, 8:27 am

(Jul 2, 2015 08:26 AM)evarand123 Wrote: [\[CITE\]](#) Cant you just switch feom the steam appBut you need to log out, type password, log in.

KryziK - July 2, 2015, 7:17 pm

One improvement I would suggest would be encrypting the Steam usernames and passwords; you really don't want them stored in plain text in an XML file.

However, the program looks like it does what it says it should. I just want to make the less technical-savvy people aware that this is a potential security risk.

Sleekz - July 2, 2015, 9:53 pm

It's not a security risk at all, the only way it would be a security risk is if someone compromised your computer and at that point, well atleast with me the last thing I would be worried about is someone finding a XML file with my steam accounts in it & I'm sure that's not what they'll be looking for straight away aswell. No need for encryption it's just a little addition

No one here will trust that exe. Others like to download the source to see how well it's made.

```
Code Process.Start("C:\Program Files (x86)\Steam\Steam.exe", "-login " + User_label.Text + " " + PW_label.Text)
```

It's not difficult.

Back to that exe, it's obfuscated. You posted the source, so what is there to hide?

KryziK - July 2, 2015, 11:17 pm

Which is still a security risk. I understand it's small and almost negligible, but people who run this and don't know how it works should know that it's plaintext. I'm not bashing the program/code at all, just suggesting an improvement (possibly for OP to learn more) and helping keep users safe.

Sleekz - July 2, 2015, 11:30 pm

Looks to me like it was obfuscated by dotnet patcher... I don't care about obfuscation but what's the point for it in this?

Illusionisten - July 18, 2015, 12:37 am

Obfuscating my exe's is just a habit, you're completely free to just compile it yourself.

It takes 5min max to add encryption if you're not going to write a completely class from the bottom. I

didn't think about ppl wanting lurk trough xml files but sure if people don't know how to do it I suppose I could add one.

That wasn't the issue. This was

<https://www.virustotal.com/en/file/4337256f07facdca66b9b336e93f70a20a7d97621e9b61dab4a3b33fbbc89d70/analysis/1437292129/>

It keeps rising as the days go by.

I do not gain anything by infecting my own files. If you feel unsafe, open the source, read it, compile your own version.

I understand that there's a lot of mongoloyd kids here at HF but don't you dare to say that my shit is backdoor'd or w/e. Most malicious thing I've done related to this, is sending shutdown bat's in class 10yrs ago.

(Jul 19, 2015 07:33 PM)skate101 Wrote: [\[CITE\]](#) WOAH! Thanks for posting that!

If you feel unsafe but still interested just download the source...
