Thread: [Recommended settings for Razorcrypter + Luminosity link](#)

PirateSec - July 1, 2015, 7:23 pm

Everytime i crypt the file and try to run it, it automatically turns itself on and off within like 3 seconds.

Could somebody recommend the right settings for it?

When using a crypter it is important to remember that using the crypters settings (Start up, options, etc) it will cause a conflict if the Luminosity binary also has settings like that configured. (Double over on same type of start options)

It sounds as though this is the issue you are experiencing. Luminosity like most other RATs will conflict if the same process thread is detected twice. the binary will issue its own kill command, causing both processes to terminate.

Recommend making a binary build with only BARE options and use the crypters settings for startup run times etc. ?

Make sure you are Not using Same features like Startup and such from Both.
