Thread: [\[Janus\] SQLi challenge #17 \[hard\]](#)

JaNuS18 - July 2, 2015, 3:19 am

Hi folks

My previous challenge [#16](#) was warming up for challenge #17. Challenge #17 is probably my hardest till now... Task in #17 is same as in [#16](#). The only difference is we can use ONLY one SELECT in complete code.

~ Tasks ~

- display numbered list of all databases with table name where maximum and minimum records were found (among all tables from that database) - see proof picture

~ Target ~

aHR0cDovL2JyYW50aHdhaXRiY290dGFnZXMuY28udWs=

(Base64 decode it using online decoder like <https://www.base64decode.org/>)

~ Proof ~

[img]<http://img11.hostingpics.net/pics/688810challenge17.jpg>[/img]

~ Rules ~

- use union select (GET)
- you can have max. 1 SELECT statement in your complete syntax (that one used in combination with UNION)
- you can use one local variable but only for numbering databases
- you may not use group_concat
- your injection should work without knowing anything about databases/tables/records on that site
- don't ask for hints or solution

Post your syntax to <https://privnote.com> (it is automatically destroyed after reading) and send me link to PM

Let's SQL knowledge be with you ?

~ Solvers ~

And we both (+ some others) know the answer ?

It has what I needed for that task...

Soham K - August 29, 2015, 1:19 am

whats the solution ? ?

b1ack-c0d3 - October 23, 2015, 2:02 am

can someone please take me through the solution...step by step
i'm still learning and this is where i learn from but some of the tasks are beyond me.
if it's possible can you guys always tutor us through the solutions to every/any task you post ?

thanks

It is a challenge, why would people advice you on open challenges ?
