Thread: [HWID Generator, Verifier and Program Protector](#)

Velocity™ - July 4, 2015, 6:12 am

So I coded this myself... Took over 4 days of (Not 24/7 coding) coding and learning.
This may be fairly easy to some, but Im hoping to help newbies that are into this sector.

Features:

- HWID Generator and Grabber
- HWID Register to ALLOW HWIDS
- HWID Verifier to check if the person running the programs HWID is on the ALLOW LIST
- Uses PHP Code

Screenshots:

Spoiler ([Click to View](#))

PROTECTOR:

MANAGER:

Things to know:

You'll have to fill in some parts... so go through the code and I have put in caps things you need to do. Its not hard, just replacing links.

You have to have a webhost or something to host the PHP files.

Tips:

Use something to encrypt your huids.txt file, or encrypt/encode it within C#.

If you need any assistance be sure to shoot me up with a PM or reply :)

Download: <http://www.mediafire.com/download/cj4q3dze15zz1h4/ProtectProject.rar>

Virus Scan: Its the source, bud.

Thanks! :)

+Haze - July 4, 2015, 6:21 am

- 1) We live in a day and age where code like this should be posted on GitHub.
- 2) Also HWIDs should be a in database and not a .txt file.
- 3) Your HWIDs are also not encrypted and in plain sight + txt file. It takes 1 second to use a HTTP debugger/snifferto find the URL and get a hold of your site.
- 4) You should also be using POST request to add the HWID and echo out JSON formatted responses.

Other than that, it's the thought that counts so well done!

(1) uh okay. lol okay.

(2) That's totally up to the person who downloads my source to make that change.

As of (3): Read the tips, I state to use a good encrypt method.

and (4): Once again, read up (2).

Thanks anyway bud! ??

Sorry mate but this is not secure.

This maybe prevent total noobs from leeching but just using a crypter does not make this thing secure.

As haze said you can use wireshark to sniff everything it sends and gets.

My tip for you : Use PHP on your webserver to check for the HWID in a DB.

Also use different things like username processor HDD etc etc and combine it into a string .

Use lambda expressions to "hide" strings in the code.

there are looooooads of stuff you can do to add SOME protection to this but please dont think it is secure.

If you want to be secure use a C++ code to generate the HWID and as i said before use PHP with MySQL together to store and check the HWID on the server.

Think of using AES or smth else to protect the traffic that is being sent between server and programm

.

Why don't you edit it by yourself?

Best regards,
Capra.

You do realize that the post is from 2015, right?

If a skid like you added it then I guess that it is not a problem for anyone else to do it, correct?

Best regards,
Capra.

do you feel that I somehow offended you? ?

why are you even answering the question if you are not that person?

Because you're actually blind and you can't see that OP is unregistered and that this is a thread from 2015.

Best regards,
Capra.

so what you fucking idiot? I will just ignore you now! And stop playing here the experienced top user because you know shit.If you do not like my comment just fuck off. Stop crying now.

0xDEAD10CC - December 10, 2019, 10:11 am

100% not secure at all...

Take another look at how you speak to others. It was not acceptable.

Thread closed for grave digging and useless argument.
