Thread: [Completed 6 years of RaTTing | Share your RATting experience](#)

RaT KinG - July 25, 2015, 8:02 am

Hey guyz i started learning RATs in late 2010 ..
mY first RATs were cerberus RAT/CyberGate. ..
enjoyed pretty much while ratting on torrents and other sites.

I have been giving private RAT mentoring services...
since 2 years.

and i have Ratted over 150k machines from all over the world :-)

Share your ratting experience!!!
when did u guyz started..?? ?

Kaiz3R - July 25, 2015, 8:04 am

Congratulations on ratting over 150k machines. Was this with their consent?

RaT KinG - July 25, 2015, 8:09 am

actually my intentions were just fun and good nothing much ..
learning was my main goal ... so except my targets i didnt harm any machines.. just used for mining
/ testing and traffic purposes

YunoLawliet - July 25, 2015, 8:11 am

How many bots do you have now?
And how many bots did you have the most?

RaT KinG - July 25, 2015, 8:14 am

I dont usually open my RAT .. but if i get some time to open my RAT then i get around 400-500
online .. i am using NJ RAT ...

i had 6 botnets and highest i had were 22k bots on a single net

edicemo - July 25, 2015, 8:18 am

Have you ever had any trouble with the Law?

RaT KinG - July 25, 2015, 8:31 am

(Jul 25, 2015 08:18 AM)edicemo Wrote: [\[CITE\]](#) Have you ever had any trouble with the Law?
Not much.. Just got my DNS accounts banned from several Dns providers..around 30-40

Ehh??

Do i even know you ??

Acquire Zion - July 25, 2015, 11:20 am

150k installs, jeez thats quite a thing to admit hahah

Jinu - July 26, 2015, 2:37 am

That's great buddy . Even I started my RAtIng since 2010 as well. In the course of time I learned so many things. And it was awesome and it continues.

OneHundred14 - July 26, 2015, 3:53 am

I have a big problem with ratting and I think is a universal problem. Sometimes, when I make a little spread of my rat binded with another program, i got like 30-40 users online, then i update my rat with another FUD file. But the next week i dont have more than 15 users online. In one month i have only 3-5 users online.

Is there any way to keep all that users infected? Is a big pain to work all day spreading and get success, for lose all users very fast. I can spread and get more than 100 users, but im happy only with 30-50 users online, but i never got it for more than a week, i always lose them. Is not for detections, i losed users who dont have any AV installed.

If your Slaves dont have antivirus installed then why are u updating them with a new one...

you have to be very specific when u r updating your stub .. You should test it into several machines with startup because may be you crypted it with a bad crypter or a it has got some depenencies so machines which are not running .net compatible will lose the connection ...

and yes with time slaves will loose numbers you cant say whats the reason may be they restored system, tehere antivirus delted it, may be they formatted or reinstalled OS... etc etc

that i why you keep it spreading so u wont loose much numbers ... i have kept some slaves for over two years..

also if u are trying to install multiple RATs on same slave machine with a same port then u will loose the slave too ..

Always select ur crypter which best suitable fr u and try it on 5 slaves and see the behaviour once its tested then update the other ones too .. if u need more assistance then PM me

good to hear mate. : D...

cd_jpnes - July 26, 2015, 5:25 am

Wow, Amazing number of machines.

R.I.P VACation Time - July 26, 2015, 5:30 am

rat king add me please bro on skype

jozeph102

want some help :(

Armada - July 26, 2015, 5:51 am

Takes a trip down memory lane

Well, to start for me, majority of the software I used, is now long gone, considered abandonware long ago. I learned on applications such as [BO](#), [NetBus](#), [Bo2K](#), and of course [Sub 7](#). These were the days when a firewall was guaranteed to be an optional software component and anti viruses were again, optional. Spreading was as simple as sending someone a file over chat saying "Hey check this out, its funny" and people blindly opened whatever was sent their direction.

I have long forgotten and lost track of total systems that have been under my control. But I remember the rush and anticipation of logging in to some privately controlled IRCd and seeing a channel filled with bots just waiting to take a command from you. Or finally managing to get the binary installed on that ONE specific person and seeing them pop up in to the controllers interface for the first time.

It has with this level of time spent, and dedication to learning the techniques to being a successful Remote Administrator that I will say the following about R.A.T.s: A level of maturity and respect is required when utilizing unrestricted access to other peoples machines.

- When you have absolute unrestricted access to a persons personal life and files, maturity and privacy must be observed.

Regardless of intent, the rest of the world will always treat a Remote Administrator as though they are shady or doing illicit actions, if when there is no malicious intent present.

People really have no understanding of key differences of a Virus, Worm, Trojan, and Malware. To the home user it is all the same. Bad.

Security is paramount to success, No one can afford to make mistakes when using Remote Administrative Tools. It only takes ONCE for the wrong machine to run your controlling binary, and it can result in steel bracelets, and a cell mate named "Big Bubba Jones". When in doubt, don't do it.

Most Memorable Times: Trolling with Sub 7. Before users were aware of vira activity, messing with someones head using the Sub 7 fun plugins was always amusing and entertaining. Watching a user freak out while opening their CD rom trays, swapping mouse buttons around and playing whatever media of choice remotly.

Seeing a pedophile be brought to justice by law enforcement due to information you handed to them.

Getting a first hand sneak preview at a new game in developments because one of the software developers was running the controlling binary. Ironically obtained from a game crack.

The evolution of R.A.T.s

Remote Administrative software suites have evolved so far over the years of my involvement, it really is an exciting time to be involved in this portion of I.T.

When I first started use, Remote Admins or Trojan viruses were limited in functionality, never close

to a guarantee for connectivity success, and highly unstable. They were traditionally written by a single person which generally lead to many errors in the software, in both the client and server applications.

The evolution and advancement of Remote control software has literally taken the software suites beyond simple Viral entities which give a remote attacker access, but now full feature rich environments, designed to manage Thousands of endpoints from a single controller.

This really only raises the wonder of what will possibly come next in the field of Remote Administration.

Ratting since 1998

?

nice to hear you are very much experienced :) !!

u started so early guessing u might had access to technology at early age or something .
to be very frank in 1998 i was 6 years old :D and i didnt even knew what "computer" is xD !

Ratting since 1998

?wow so amazing

This is how I troll interviewers with RATs, and I started using RATs in 2011 I believe, so a year behind ya OP.

Goods - February 21, 2016, 6:41 pm

Literally started like a week ago and ive already learned so much thanks to some friends on here.

Narcist - February 21, 2016, 10:33 pm

What kind of security measures you take besides using VPN for RAT'S DNS?

Any tips would be welcome!

Xeri - February 22, 2016, 3:26 am

Sounds like a huge fucking waste of time

WarOfTheWaR - February 22, 2016, 4:26 am

150k victim gratz ?

My first rat Darkcomet 2.2

kinzokuhebi - February 22, 2016, 4:48 am

150k installs is pretty insane, my peak was around 300 back in 2012 on good old cybergate, I'm useless at it now.

Narcist - February 23, 2016, 8:07 am

Any tips on anonimity, I am using now only VPN and paid DNS.

F16™ - February 23, 2016, 12:30 pm

i start rating in 2010 from Cybergate 1.7.6 nd now NJ but not too much just for fun and keep in touch.

Pandz - August 19, 2018, 12:06 am

Do you have any idea where I can get Nanocore?

Mr.Ransom - August 19, 2018, 9:34 am

he has 150k slaves on his rat a true haxor lol if u can even hold 300 it would be extreme. you can already see him lying trough his teeth with he has ratted 150k. you cant rat 150k unless exploit kit lol

alphamodz - August 19, 2018, 2:26 pm

it's not really smart to talk about it in public, tell the other person how many people you've infected, if there's an investigation on you, one more proof to put you in jail :)

EDIT: 07-25-2015 okk bye bye
