Thread: [\[VB Net\] data item in listbox](#)

Kulls - July 25, 2015, 12:24 pm

Hello all,

I want to know how to save data to a form (containing textbox, the user has completed), "registers behind" item of the listbox. property binding does not work, or I have done wrong.

it's urgent ! and I galley, it's been that I seek no avail. : /

Thank you in advance for your answers. :)
Regards

I have no idea what this is or what it means.
But I think I like it.

`listbox1.items.add(textbox1.text)`

?

Hello,

In fact, I make an application to send SMS from their PC. (API, I have) And when we look in his mobile, to add a new contact, and although there is the same "form" that appears (name, number, address , website, etc ...)

Henceforth that you clicked on the save data for that contact, there is a list of names of those contacts. Then, if one wants to change a contact (type number), and well, the form appears well with

the data.

That is what I want to do in vb.net.

My app:

Double-click on a selected item displays the form, but it is reset, since I can not store data except of course the name of the contact.

I have 2 form:

-1 For texting

-1 Other to send MMS

All 2 contain a listbox, or there would be the contact data.

I can not too much to synchronize the two listbox same time.

I can not at all to filter the data (for he did not once or + 2, the same name of a contact).

Regards
