Thread: [How to use Instagram on PC - Upload Photos - Without Bluestacks](#)

Flayer - July 31, 2015, 10:05 am

Hello, I don't really post tutorials that often and haven't done in a long time. But i feel that its needed in this section, that people need to know how to Upload photos to Instagram and for it to be easily monitored. We all know that Instagram if used correctly can bring in good E-Whore Customers and can be used for good PPI/CPA Marketing.

This method is easy and will only take you around 5 minutes using this guide. And does NOT use Bluestacks at all.

What you will need; [Google Chrome](#)

[Instagram Account](#)

[Instagram APK](#) *Last Updated 29th July

[ARC Welder \(APP for Chrome\)](#)

I'm not going to run through how to install and run Google Chrome, because if you don't know how then i worry why you're even on HackForums. ?

And i believe you already have an Instagram account else you wouldn't be viewing this thread, but thats none of my business, the links there anyhow. ?

Now on the ARC Welder APP page, Click "[Add to Chrome](#)" Button, Either will appear in Blue or White.

The APP now should download, a box should come up asking if you want to add it, just click Add. After this a cool UI with various google chrome apps should come up, on your taskbar maybe, looks like [this](#).

Just click the ARC Welder Icon and you should be on the Welcome page, that looks like [this](#).

Now you should just make a new directory somewhere, just make a new folder, old bash the head of the keyboard style on your desktop or documents where it will store all the APK files and data from the app.

After you've done this, it should ask you to "[Add you APK](#)" Following the link i provided you with to Instagram at the top of the thread, download the APK, save it somewhere, now browse to it on the APP and select it as your APK.

After its found and verified it, you should get a screen like [this](#).

Now we have to change some settings up to make it more user friendly, this is just how i do it, but you can change it to whatever you'd prefer. These are my [options](#).

After doing this, just click "Launch" and you're ready to go. You have a more user friendly, easily accessible Instagram on your desktop.

Now onto uploading photos ?

On the APP just click the photo button as you normally would, Click "Gallery.
Now at the top of the Screen it also says "[Gallery](#)" with a arrow pointing downwards.

Click this, and then Choose "Other", From here click "Open File" and there you have it, choose any photo from your desktop, customize it, crop it and add filters to how you please. Add your captions with your skype name, kik name, PPI/CPA links, and rack in the money.

And i forgot to mention you can do this with any other APK too, so KIK, Whatsapp will also work!
If you're having a error with network, try clearing your cache, if that doesn't work try turning off developer mode if you have it enabled, and created a new profile in chrome! :P

Might need this in the future, thanks.

Viagra - July 31, 2015, 10:38 am

This is an useful tutorial. Good job.

marko14753698 - July 31, 2015, 11:19 am

Really useful man will definitely use it ty

Lugina - July 31, 2015, 11:26 am

Cant log in OP what did i do wrong

unknown network error

Gonna use this thanks op.

Phreakdaline - July 31, 2015, 3:16 pm

Just curious, why not just use Bluestacks? Just easier interface or what?

niki1234 - July 31, 2015, 3:20 pm

I use bluestacks too but try this tut as well. thanks

Bluestacks is far from as Smooth as this is. Bluestacks also has issues with uploading photos sometimes to instagram. ?
