Hi HF

i was searching in my archive projects for something today and i founded this project i wanted to share it maybe will help someone in something it was a cool old project of mine

Project name : Offline Licensing System

Last Updated : i modified some bugs today before i share it here i dont remember when i did this project cz many times i redid it from scratch

For what i can use it ? : you can use it as a offline Licensing System there will be a generated XML file

Is this project free of bugs or completed :NO i abandoned this project for many reasons need allot of works on XML generated file

how this will help you : there is many functions and many ways to think how i created this and you can recreate new one based on this idea

how to use it ? : build it -> generate XML open your requests and then export it ->to see your license working there is a reader form TEST LAB you can test it in same directory , as this form you can take this functions and add it to your X application

Download Link : i deleted all build-ed files
