Thread: [Got experience with "atomic mail sender?"](#)

sumhelpm8 - August 3, 2015, 3:40 pm

Dear hackforum members,

First of all(sorry for bad English)

Second i'm looking for someone with experience in the program called "atomic mail sender". To be more specific i need someone that can guide me through teamviewer or skype, it doesn't really matter the point is that i need to learn how to send mass e-mails. I've read something about: ""SMTP servers" but it's still not very clear to me. Basically i need to send about 10.000 mails per day. I'm using Gmail which only allows me to send 100 per day, so that won't cut it.

The pay depends on how difficult it is and how long it will take us to figure it out.

Hit me up on skype if you think you're up for the challenge. rico.benatia

Well, it's really simple. Try to find "sanmao smtp cracker", find an "email scraper" or "email harvester" and blacklist domains of popular SMTP server, i.e. @gmail, @hotmail, @tin.it, then simply run the Sanmao cracker on an RDP and let it brute, you should get some decent smtps with the basic password list. Once you do that, you can simply input it into AMS and put your message and email list that you're mailing to, press send, done.

I recommend Maxbulk mailer. If you don't feel like bruting, SMTPs are cheap.
