- report length of shortest column name in primary database
- report how many such columns in primary database exists
- display all such columns (with their tables)

~ Proof ~

~ Rules ~

- use union select (GET)
- only operator = (is equal)) from comparison operators may be used (others like <, >, <=, >=, <> or != are not allowed)
- group_concat, substring_index, order by and group by are not allowed.
- any variation of DIOS is not allowed
- your injection should work without knowing anything about tables, columns and databases on that site
- don't ask for hints or solution

Post your syntax to <https://privnote.com> (it is automatically destroyed after reading) and send me link to PM
