Thread: [Giving a RAT to specific target](#)

justanotherandrew - August 7, 2015, 10:23 pm

Tell me fellow users on hackforums, what is the best way to give a RAT/stub to a specific target? I have some general ideas but any tips and tricks? ?

Supreme??????? - August 7, 2015, 10:24 pm

You can bind it with a legit program, and have them run it. If your file is FUD, then they won't know that it's running in the background.

Ah, a sound idea thank you. Anyway how would i do this? I know how to spoof and make a fake error message but never have i tried to bind it to a legit program. Linking me to a thread or just telling me would be nice

LilHackers - August 7, 2015, 10:55 pm

It's simply just buy a crypter it really cheap here, or try using boshos's free crypter. Good luck on passing anti-skid.

Happy ratting :D

Hah ive tried the antiskid but no luck for a skid like me, and i know how to use a crypter as i have web based ones and amusecrypt but how do i bind it to a program?

You need a file binder. Get a crypter with a (run once) binder.

matissshakeris - August 8, 2015, 5:40 am

Best method for target spread is "Hey wanna get on ts with me" And then use teamspeak 3 spreading method on him. He get on your ts download your fake update and boom hes yours.

Otherwise you could try using scr file or pif file and bind it with picture and tell him to check this fake girl he got from steam.

Done.

Armada - August 8, 2015, 5:51 am

This is what I have come to call a "Targeted Binary".

What I do in general for a Targeted install like this is first determine 2-3 methods of deployment to the target. Depending on how computer savvy the user is and how well they know\trust you will vary method of deployment greatly.

Document exploit

Links to infected software

Bound Software

Web based exploits

Document exploits are very effective and a easy way to send files to people.

If the user trusts you a little more, I would highly suggest sending a bound file with the binary. THis is the most straight forward and effective method.

Ok so say i have one of my friends skype, ive tried things like sending the file directly and sendin him a link. Neither of them did he trust. I might need to do some research on a document exploit and bound software as i do not know how to do either. But thank you for the information ?

Highly suggest preying on something they either greatly want or are looking for.

Social Engineering.

Find a program of some sort, something he would want.

Does he play games?

Does he have any vulnerability?

Find a niche and work on it.

Activo - August 8, 2015, 11:31 am

You can do it with Youtube videos.

If you want CS:GO slaves, make a CS:GO skin generator or whatever.

If you want a skid, make a L33T DDoS T00L.

Make sure they're binded for better results.

justanotherandrew - August 8, 2015, 11:37 am

Ah yes i got that down, i can be very convincing when i want to. Anyway do you have a free programs i can use? The only crypter i have is AmuseCrypt and the RAT i have are njRAT and DarkComet. I need a binder and stuff.

This is not what he was looking for, you should've read the thread before posting.

Ah well i cant PM yet, need 50 posts.

(Aug 8, 2015 12:14 PM)A?mªDa Wrote: [\[CITE\]](#) Shoot me a PM with your skype, I can see what can be done ?

Ok nevermind i PM'ed you, i swear i thought it said 50 posts are required

#Skyline - August 8, 2015, 1:43 pm

If you know how to compile a basic doc exploit and bind it with your .exe, this should do the trick. Because I know for a fact people are stupid and think word files won't do damage.

justanotherandrew - August 8, 2015, 3:22 pm

Oh yea i'll just write a document like "Free minecraft premium accounts" and let the damage be done. Thing is i still need to learn how to bind my stub and a program or document ?
