Thread: [How to Create a simple SMS Bomber \[NooB Friendly\]](#)

Illuminatty - August 8, 2015, 7:56 pm

What You Need:

Microsoft Visual Basic or Studio
Some Time
A Brain

First Create your new Windows Form Application in VB

You Must now add these components from the toolbox onto your form.

- *5 Text Boxes
- *2 Buttons
- *1 Rich Text Box
- *1 Combo Box

Here is what each does...

Spoiler ([Click to View](#))
Textbox1=Phone number
Textbox2=Subject
Textbox3=Your Gmail Username
Textbox4=Your Gmail Password
Textbox5=Number of Messages to send

Button1=Send button
Button2=Exit Button (Optional)

RichTextBox1=Message Body
Combobox1=Carrier Selection

Should look something like this
Spoiler ([Click to View](#))

Now double click on the form design or right click and click "view code"
Before the Public Class add this
Code Imports System.Web
Imports System.IO
Imports System.Net.Mail

Now Double Click Button 1 and add the code
[CODE](#)

In the code you will notice this line of code

```
Code SmtpServer.Credentials = New Net.NetworkCredential(TextBox3.Text, TextBox4.Text)
```

Textbox3.text would be the textbox where you enter your gmail information and textbox4.text is the password. If you want you can integrate the gmail into the program if your going to be the only person using it. To do this just write something like this instead

```
Code SmtpServer.Credentials = New Net.NetworkCredential("YourGmail@gmail.com",  
"YourGmailPassword")
```

Now double click your button 2 and add this

```
Code END
```

This just exits the program

Now you need to click on the little arrow of your combobox and select "Edit items" should look like this

Add these strings in the box that pops up.

Code Sprint PCS

Verizon

Boost U.S

T-Mobile (Germany)

7-11 Speakout

Airtel (Karnataka, India)

Airtel Wireless (Montana, USA)

Alaska Communications Systems

Aql

AT&T

AT&T Enterprise Paging

BigRedGiant Mobile Solutions

Bell Mobility & Solo Mobile

BPL Mobile

Cellular One

CingularCingular (Postpaid)

Centennial Wireless

Cingular (GoPhone prepaid)

Claro (Brasil)

Claro (Nicaragua)

Comcel

Cricket

CTI

Emtel

Fido

General Communications Inc.

Globalstar (satellite)

Helio

Illinois Valley Cellular

Iridium (satellite)

Iusacell

i wireless

Koodo Mobile

LMT

Meteor

Mero Mobile

MetroPCS
Movicom
Mobitel
Movistar
MTN
MTS
Nextel (United States)
Nextel (Argentina)
Orange Polska
Personal
Plus GSM
President's Choice
Qwest
Rogers
SL Interactive
Sasktel
Setar Mobile email (Aruba)
Suncom
T-Mobile (USA)
T-Mobile (Austria)
T-Mobile (UK)
Telus Mobility
Thumb Cellular
Tigo (Formerly Ola)
Tracfone (prepaid)
Unicel
Virgin Mobile (USA)
Virgin Mobile (Canada)
Vodacom (South Africa)
Vodafone (Italy)
YCC
MobiPCS (Hawaii only)

Now its time to create your Sexy GUI... Play around with it, create labels for your textboxes and have fun with it.

Heres what mine now looks like

<http://prntscr.com/82ho16>

When your done with your design click File>Save all and save it somewhere then on the top click Build>Build "Application name here" Then go to the folder you saved it in and navigate to bin>release

There you will see your finished .exe application

wilfriedp - August 11, 2015, 4:26 am

Thanks you, great tutorial.

tweety - August 11, 2015, 5:56 am

Can you please delete the thread. Thanks.

Josh? - August 11, 2015, 7:41 am

So we have a form that looks nice. Now what?

EDIT: Didn't see the pastebin link.

OP, I would suggest a select case rather than many if, elseif statements.

Also, you do not need to check every if statement to set the subject/body/message, you can just do that once.
