Thread: [Debian 7.7 wheezy](#)

UnarmedBlack - August 17, 2015, 4:22 pm

Looking for someone who could setup squid3 for me. Or atleast explains how.

Loki123 - August 17, 2015, 4:34 pm

<https://www.lisenet.com/2014/install-and-configure-squid3-caching-proxy-on-debian-wheezy/>

Google comes to the rescue quite often doesn't it...

Don't give up so easily. If you expect us to help we need to know what went wrong with the installation.

Nearly all tutorials are outdated, means that i use the wrong name and stuff. Im not experienced with debian 7 wheezy too, which makes it harder for me.

Follow the tutorial here and let me know which steps you get stuck on.

When i want to mount the partition with this command

```
mount -o rw,noatime,notail /dev/sdb1 /var/spool/squid3-ssd/
```

i get this error <https://i.imgur.com/fQaCTi3.png>

That part is optional. The reason you get that error is because that disk does not exist. You will need to create a partition and then replace "/dev/sdb1" with "/dev/<what ever the new partition is>"

But if you do not know how you should probably just skip it.

Okay. But now, there is a part where i need to edit the config. I know how to search and save changes, but how do i edit the config again? I know that i need to be in the directory, but i just forgot the command for it. Thank you for helping me :)

Use:

```
nano <path/to/config>
```

Then ctrl + x y to close and save.

UnarmedBlack - August 18, 2015, 5:22 am

Okay, i opened the config. But instead of seeing the whole config, i can only see one page. Do i need to browse all pages and search for the "acl LAN " command?
