Thread: [Submit button not sending anything](#)

Facebook Inc - August 24, 2015, 8:07 pm

I'm trying to use this custom-built submit button that was made with this website design that I'm using and I don't know how to make the submit button send a POST request with the forms on my page. So far the only thing the button does is make a "Thank you!" show on the webpage. I'm trying to just make a simple POST request submit button.

Here is the code:

Code //Signup Form.

```
(function() {

    // Vars.
    var $form = document.querySelectorAll('#signup-form')[0],
        $submit = document.querySelectorAll('#signup-form input[type="submit"]')[0],
        $message;

    // Bail if addEventListener isn't supported.
    if (!('addEventListener' in $form))
        return;

    // Message.
    $message = document.createElement('span');
    $message.classList.add('message');
    $form.appendChild($message);

    $message._show = function(type, text) {

        $message.innerHTML = text;
        $message.classList.add(type);
        $message.classList.add('visible');

        window.setTimeout(function() {
            $message._hide();
        }, 3000);

    };

    $message._hide = function() {
        $message.classList.remove('visible');
    };

    // Events.
    // Note: If you're *not* using AJAX, get rid of this event listener.
    $form.addEventListener('submit', function(event) {

        event.stopPropagation();
        event.preventDefault();
```

```

// Hide message.
$message._hide();

// Disable submit.
$submit.disabled = true;

// Process form.
// Note: Doesn't actually do anything yet (other than report back with a "thank you"),
// but there's enough here to piece together a working AJAX submission call that does.
window.setTimeout(function() {

    // Reset form.
    $form.reset();

    // Enable submit.
    $submit.disabled = false;

    // Show message.
    $message._show('success', 'Thank you!');
    //$message._show('failure', 'Something went wrong. Please try again.');
```

}, 750);

});

Look at this part of the code:

```

Code // Process form.
// Note: Doesn't actually do anything yet (other than report back with a "thank you"),
// but there's enough here to piece together a working AJAX submission call that does.
window.setTimeout(function() {

    // Reset form.
    $form.reset();

    // Enable submit.
    $submit.disabled = false;

    // Show message.
    $message._show('success', 'Thank you!');
    //$message._show('failure', 'Something went wrong. Please try again.');
```

//ADD AJAX POST HERE

}, 750);
