Thread: [Hacker stole security-sensitive data from Mozilla to target Firefox users](#)

ZuGgY - September 5, 2015, 8:57 am

Quote:Firefox users were targeted via a browser exploit that was patched last month, after a hacker broke into Mozilla's bug-tracking system 'Bugzilla' to steal data about potential weaknesses.

Mozilla says that the hacker managed to access Bugzilla's "security-sensitive" information, which unlike the rest of the repository isn't made publicly available. It says that the compromised account was closed down as soon as it was discovered and that steps are being taken to improve the overall security to avoid a repeat of the situation.

One of those changes is requiring all users who are authorized to access security-sensitive information to change their passwords and use two-factor authentication. There are also new limits being placed on what each level of privileged user can access, so that if an account is compromised in future, the attacker won't be able to access as much data.

And if you're the sort of perennially worried person who frets over what other security vulnerabilities were revealed in the hack, then rest easy, as the version of Firefox released at the end of last month fixed any problems that might have been disclosed.

That is some pretty crazy stuff right there.

Balding - September 6, 2015, 4:25 am

This is why I use Chrome.

Matt Bomer™ - September 6, 2015, 6:23 am

Even Tor had some vulnerabilities last week I suppose. I use Chrome and works good for me.

Tor, FF, Chrome, IE, all browser has vulnerabilities, the best is allways use browsers inside a virtual machine, giving your sensitive data outside of VM.

sooo by joining a data mining company you went out of the frying pan and into the fire ?

Pure genius
